

P4-enabled Network Slicing and 5G User Plane Function

Professor Chien-Chao Tseng

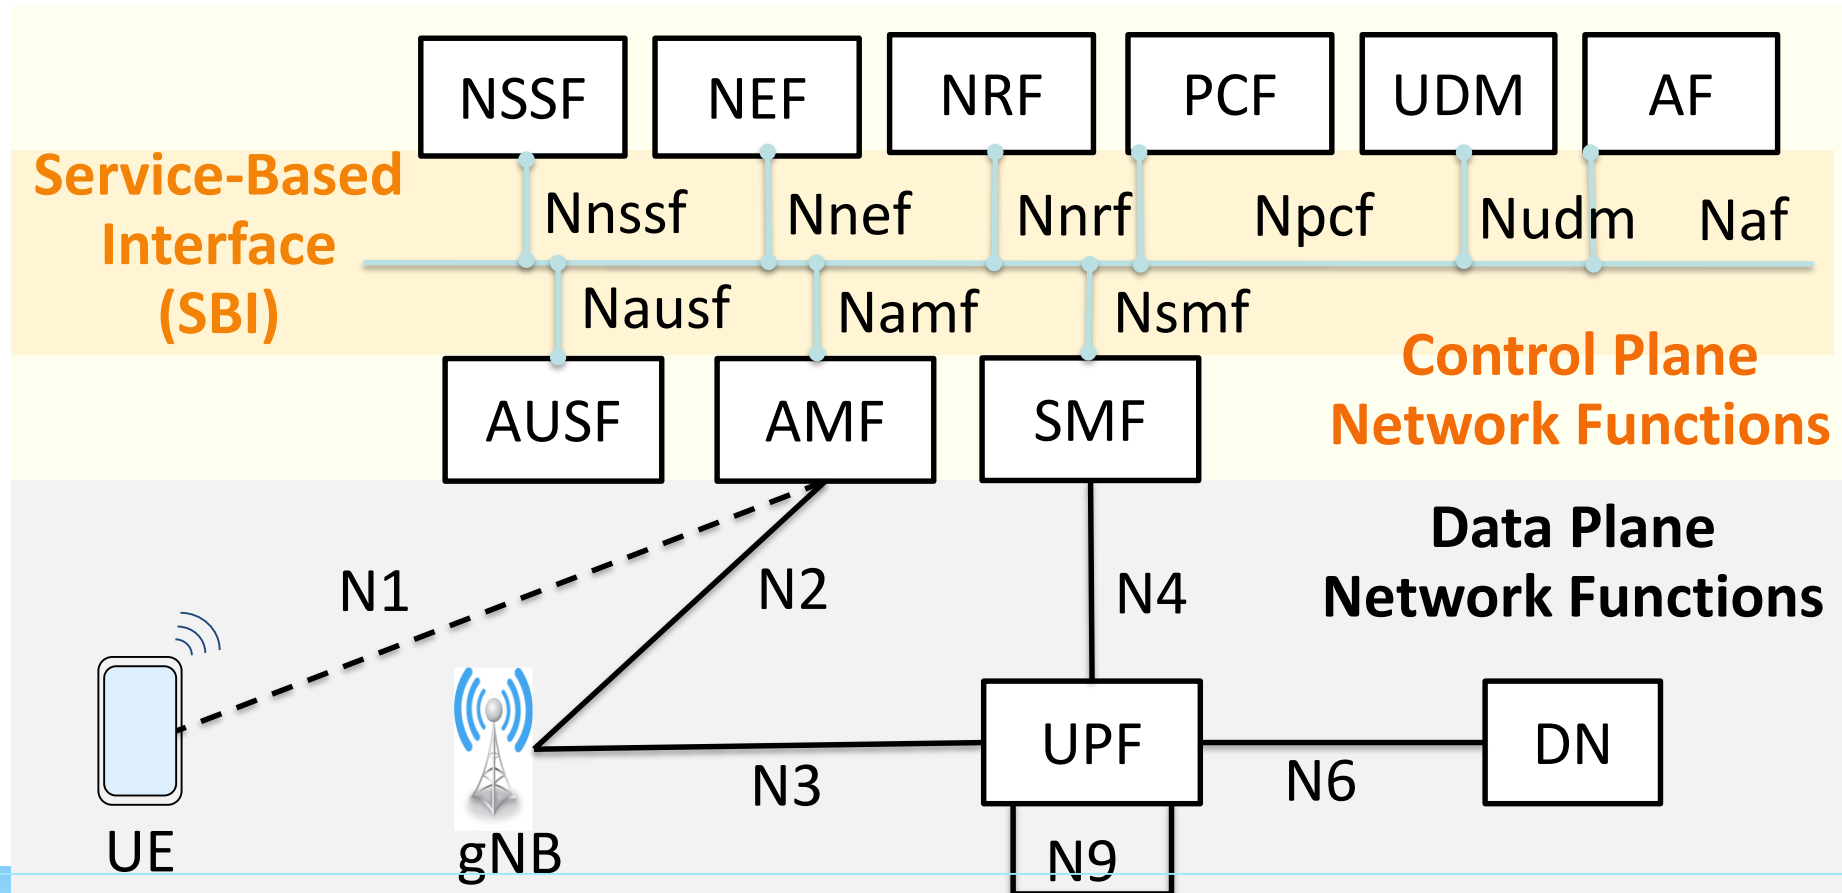

Department of Computer Science
National Yang Ming Chiao Tung University

cctseng@cs.nctu.edu.tw

5G Service Based Architecture

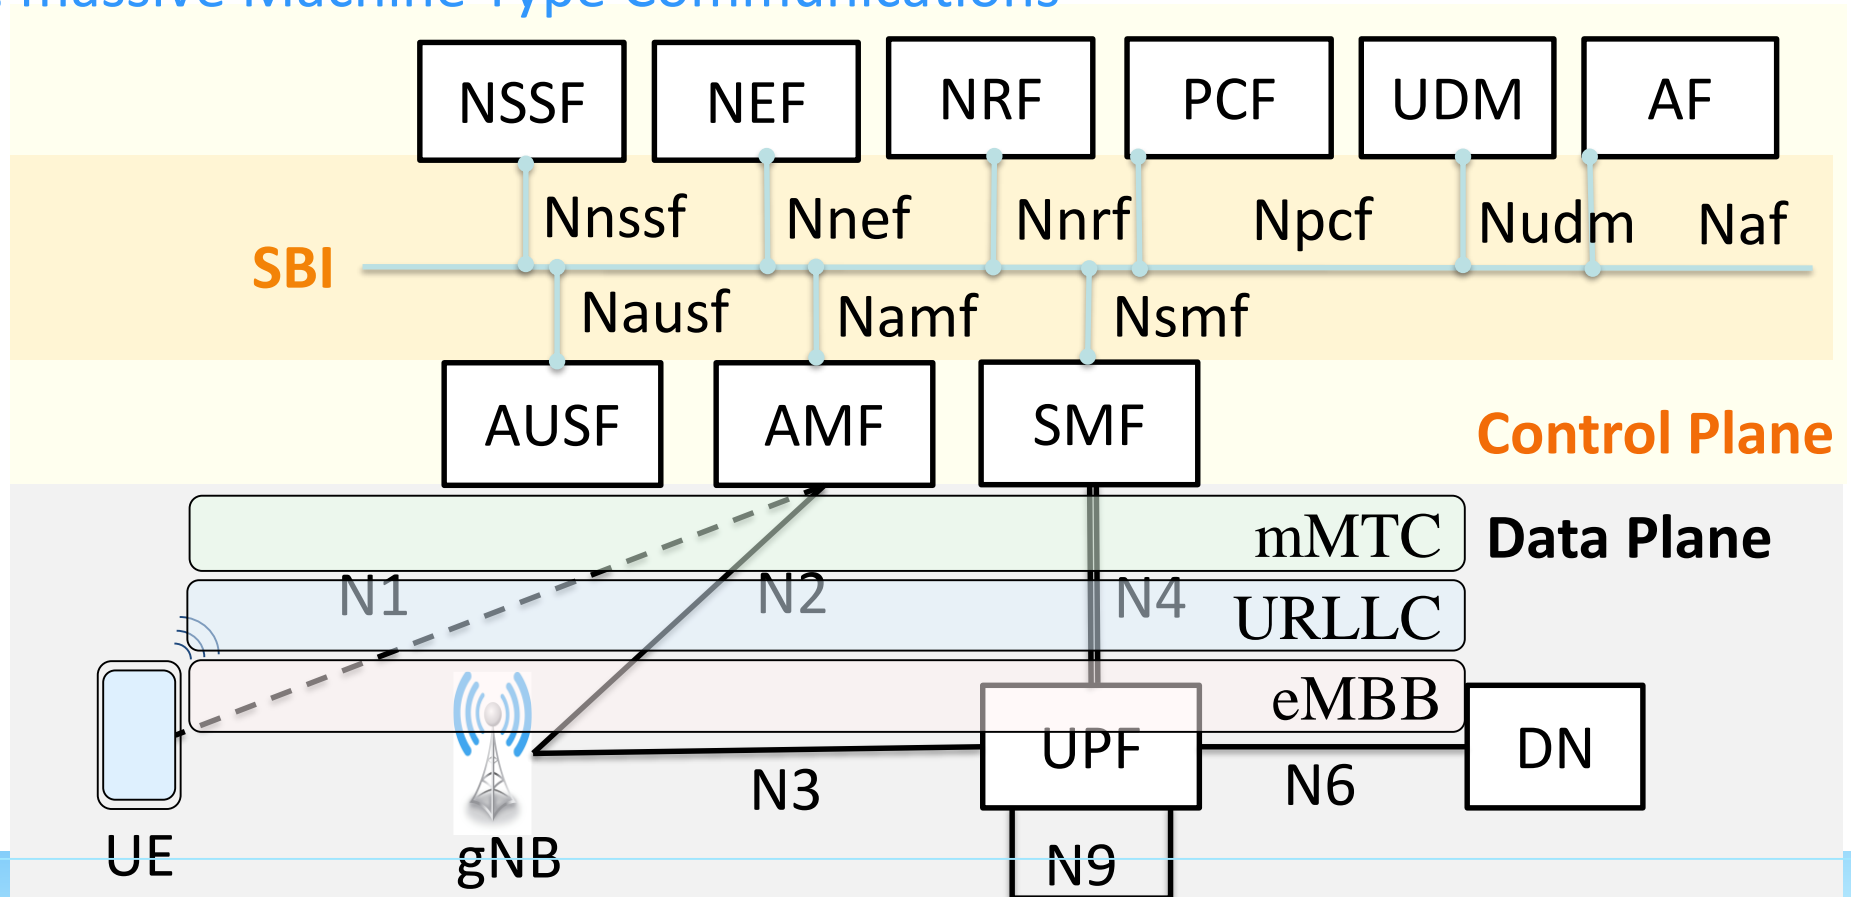

- From monolithic to modular **architecture**
 - A set of Network Functions (NFs) provide services to other authorized NFs.
 - New NFs can be rolled out without impacting existing ones.

5G Network Slicing

- To support services with different requirements
 - eMBB: enhanced Mobile Broadband
 - URLLC: Ultra Reliable Low Latency Communications
 - mMTC: massive Machine Type Communications

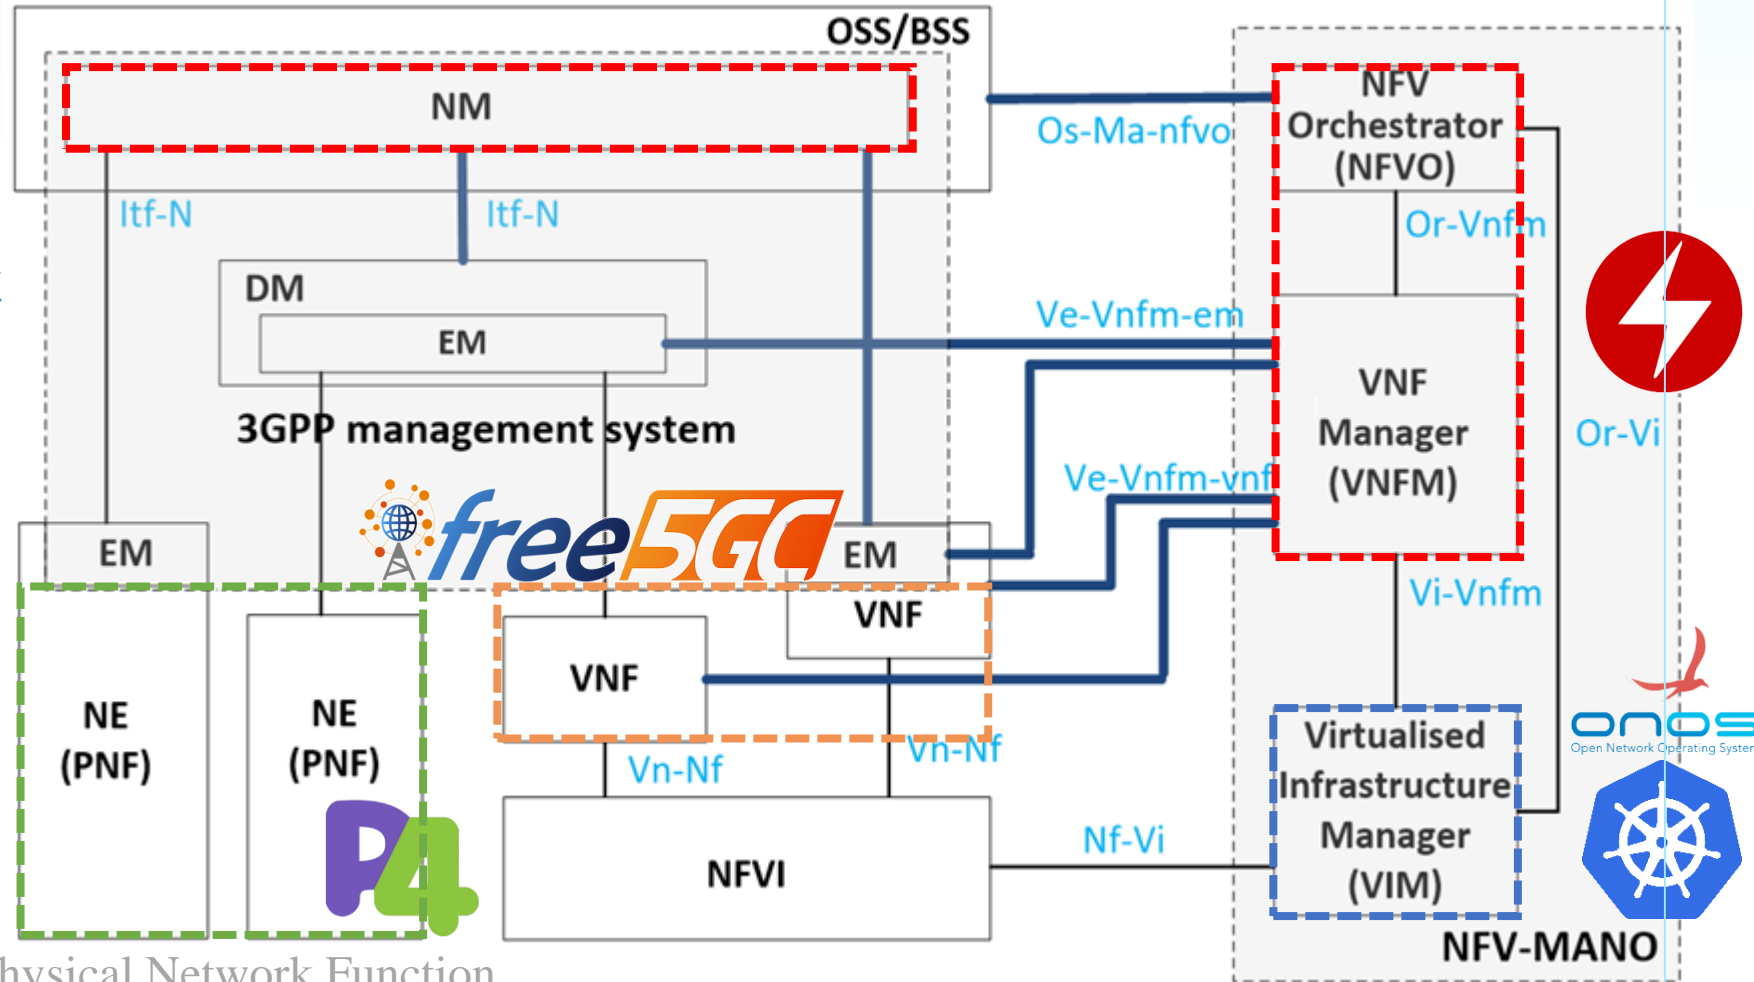

A Cloud Native Management and Orchestration Framework for 5G End-to-end Network Slicing

- Follows 3GPP Management and ETSI NFV-MANO Specification
- All open sources
- NFVO/VNFM: Operator framework
- VIM:
 - Kubernetes (Computing:)
 - ONOS (Networking)
- VNF:
 - free5GC

DM: Domain Management
EM: Element Management

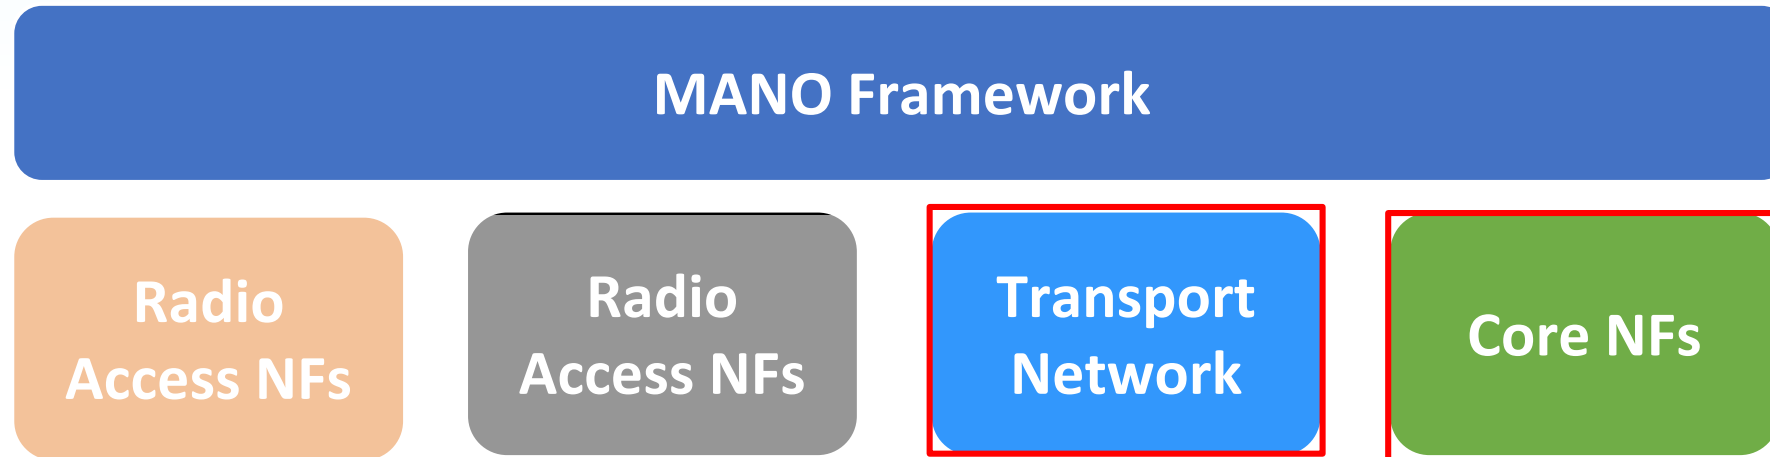

NE: Network Element, PNF: Physical Network Function
NFVI: Network Function Virtualization Infrastructure

Ref. 3GPP TS 28.500 V15.0.0

Management and Orchestration (MANO) Framework

- Automatically deploy and run 5G end-to-end network slices in cloud environments
 - All based on open source, vendor-neutral projects

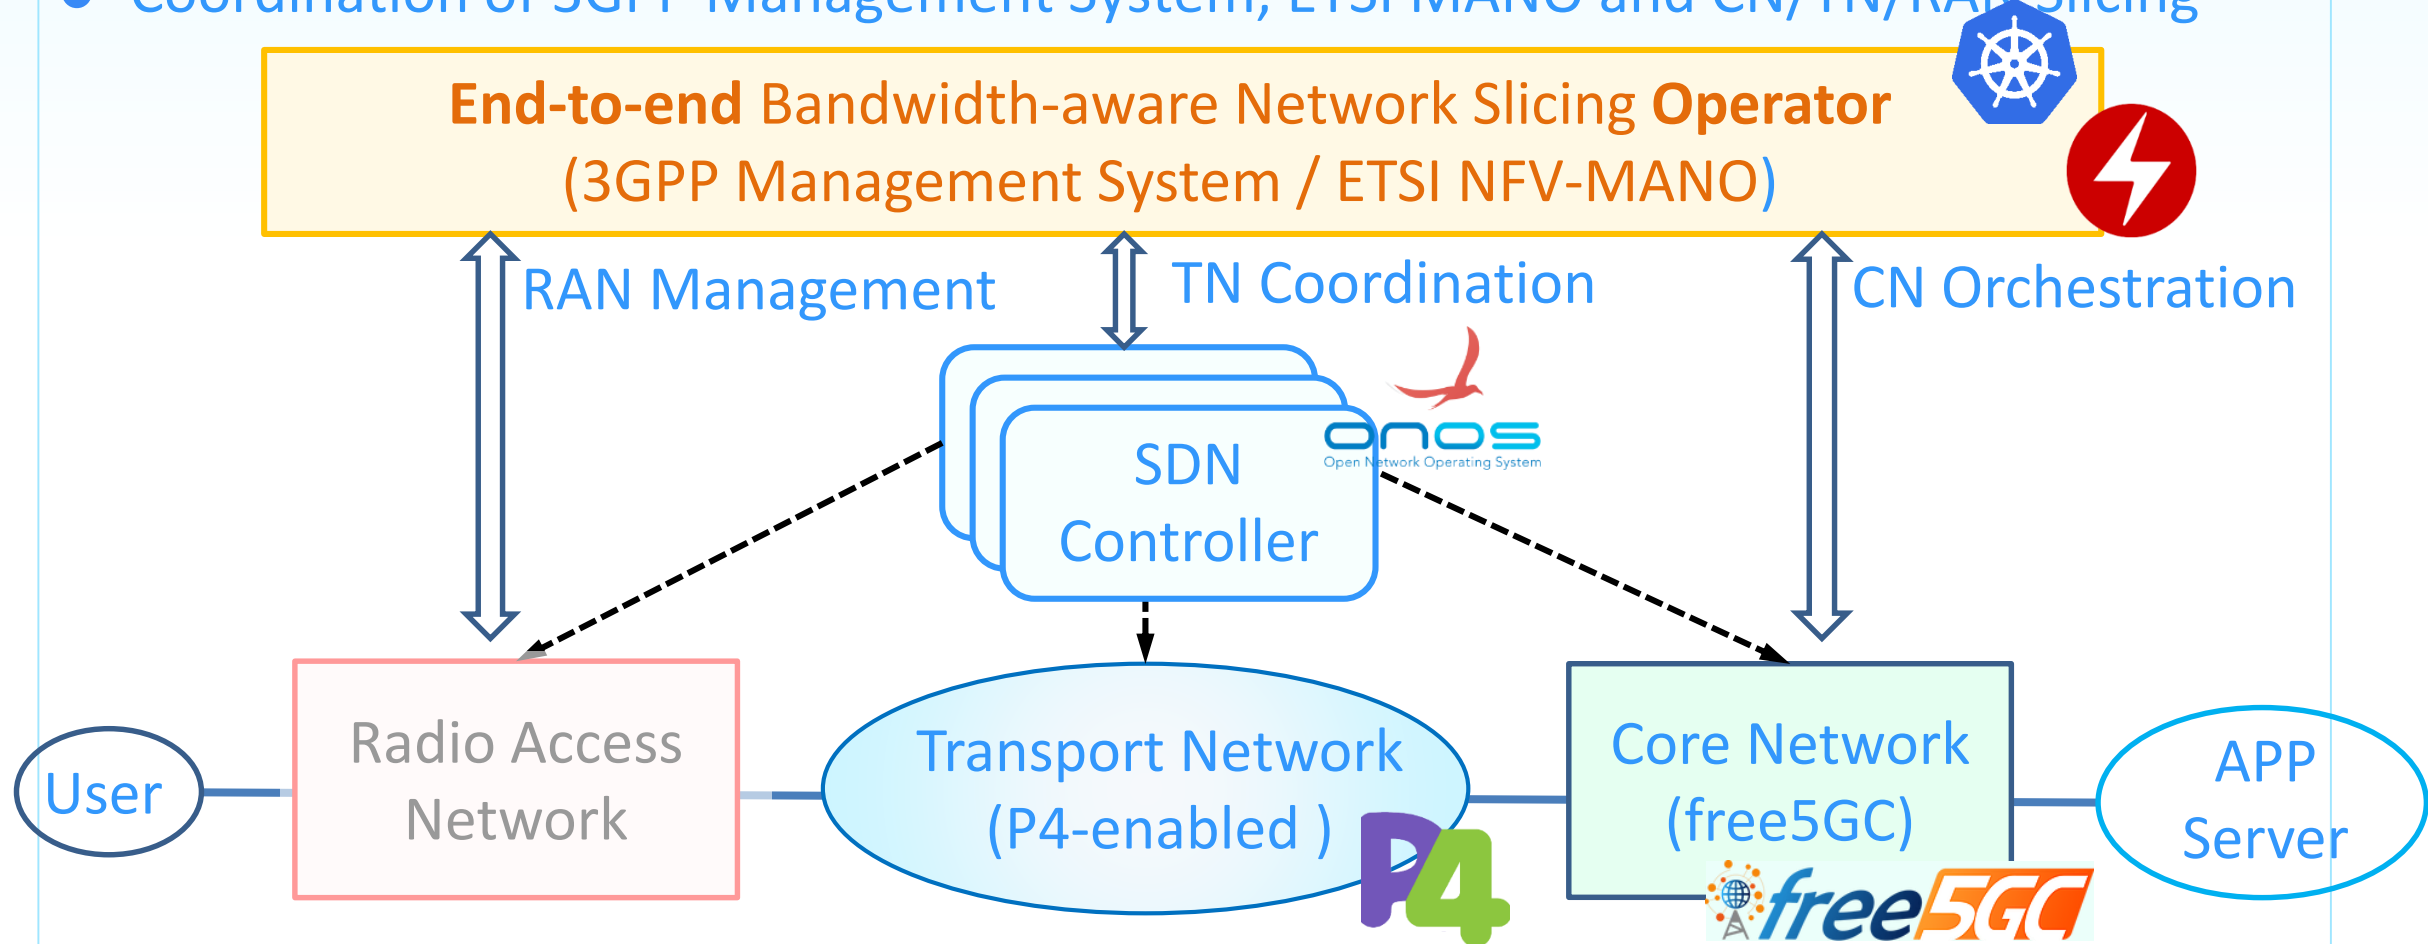

- Integrate with *P4-Enabled Bandwidth Management and UPF*
 - On **Transport Network** to enforce bandwidth policies
 - Bandwidth Guarantee and Bandwidth Limiting
 - Service Latency Guarantee
 - On 5G **User Plane Function (UPF)**

5G End-to-End Network Slicing with **Bandwidth Control**

- Coordination of 3GPP Management System, ETSI MANO and CN/TN/RAN Slicing

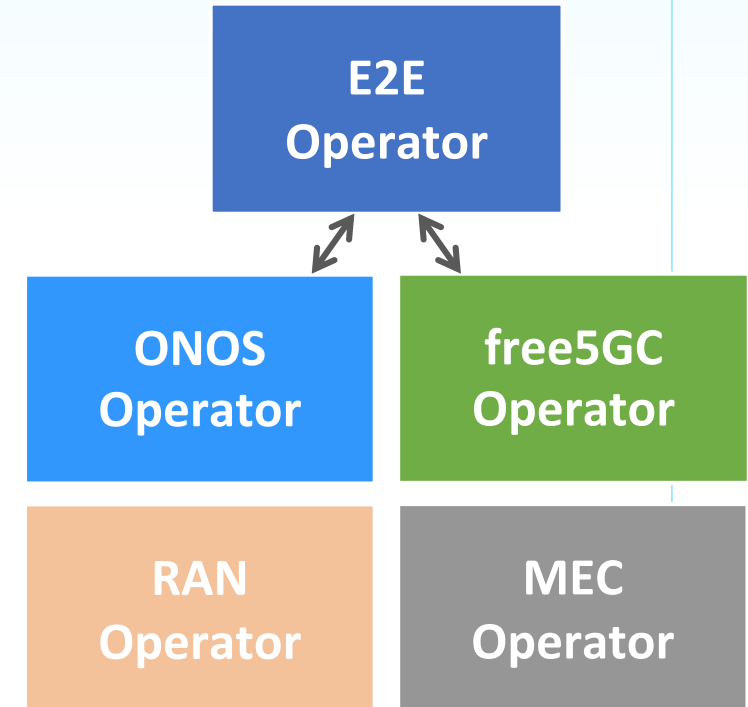

- ONF 2020 5G Transformation with Open Source Spotlight:
Cloud Native Management and Orchestration Framework for 5G End-to-End Network Slicing - Yi-Sung Chiu

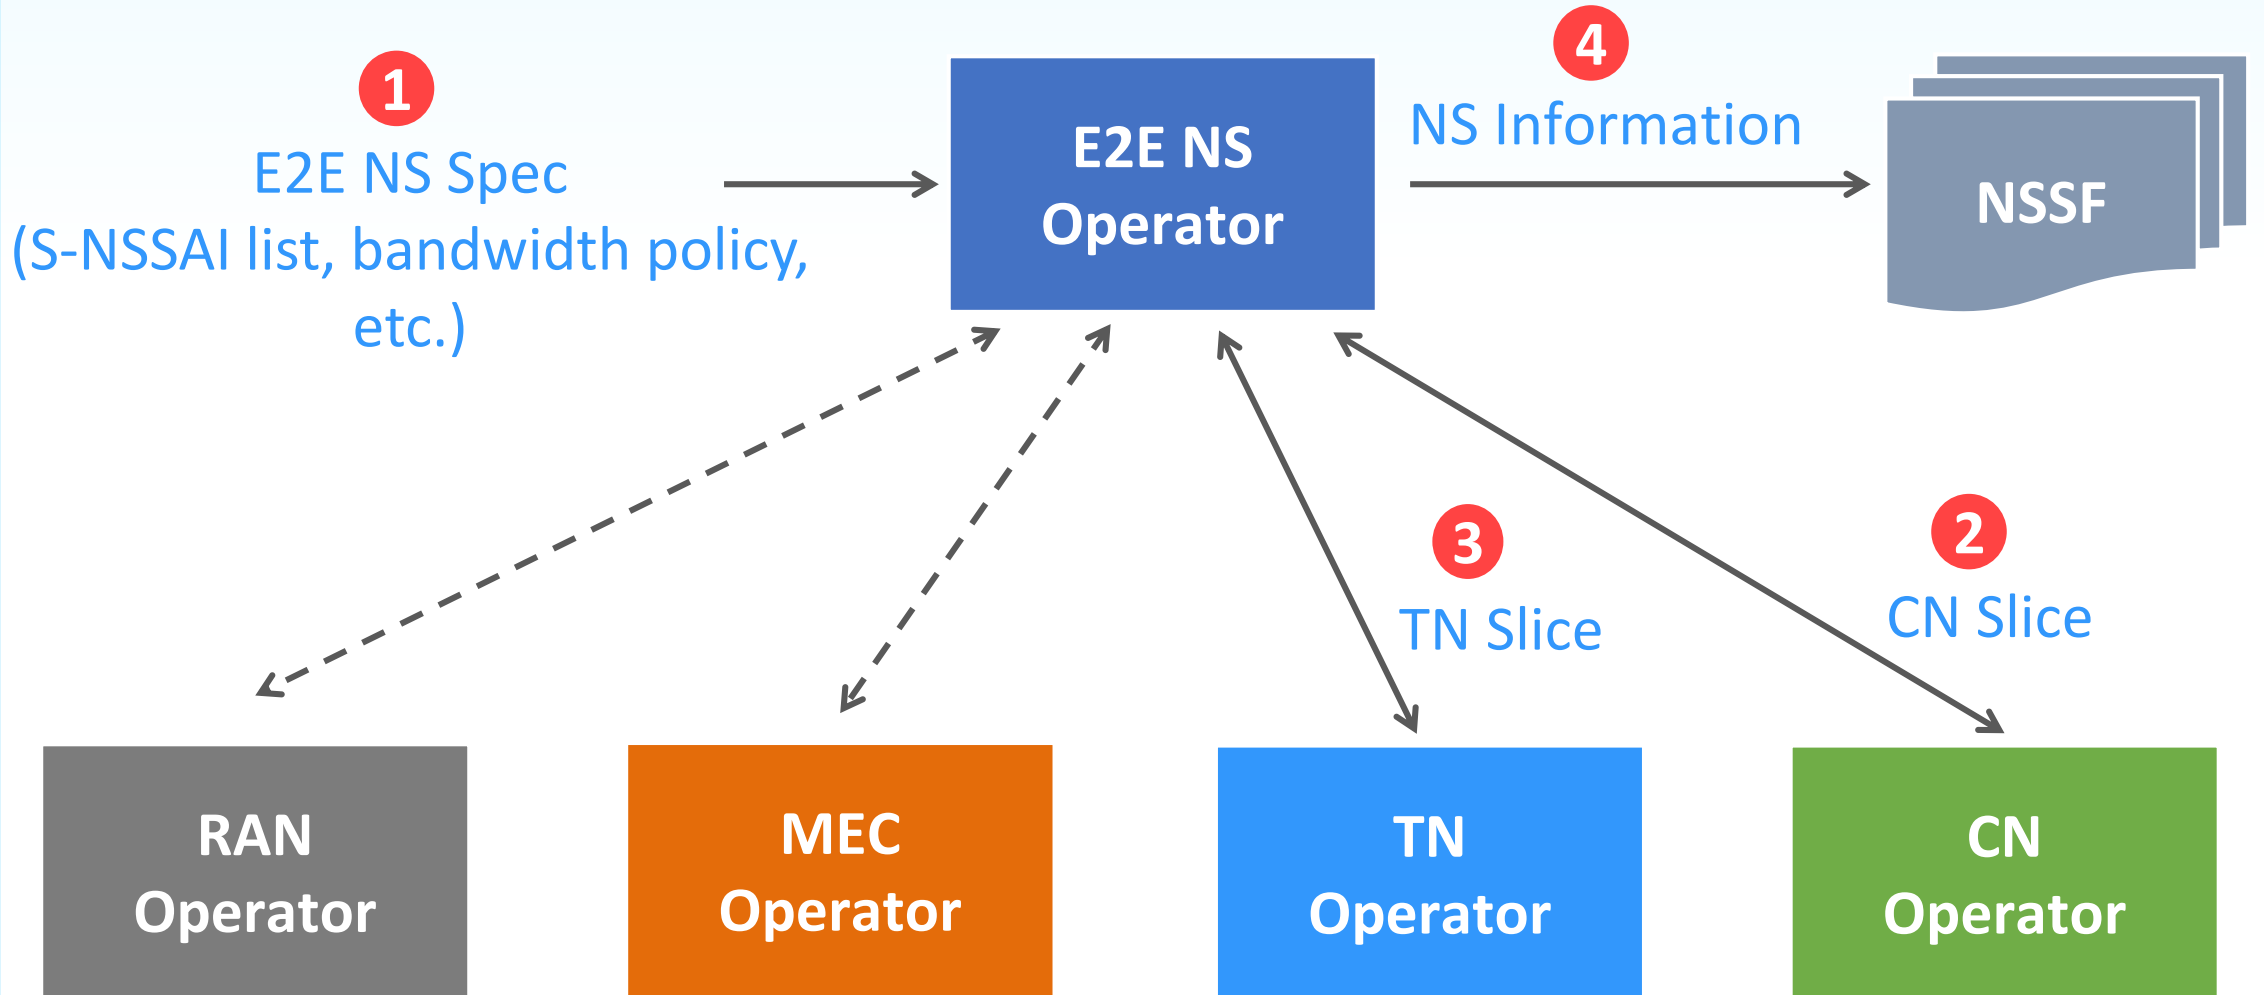

Operators in MANO Framework

- E2E Operator
 - Receive and validate BANS allocation requests
 - Orchestrate free5GC Operator and ONOS Operator
 - Update network slice selection information on NSSFs
- free5GC Operator
 - Create core functions when receiving CN slice requests
- ONOS Operator
 - Configure transport network when receiving TN slice requests

Management and Orchestration (MANO)

S-NSSAI: Single Network Slice Selection Assistance Information

E2E NS-5GC with P4 Fabric

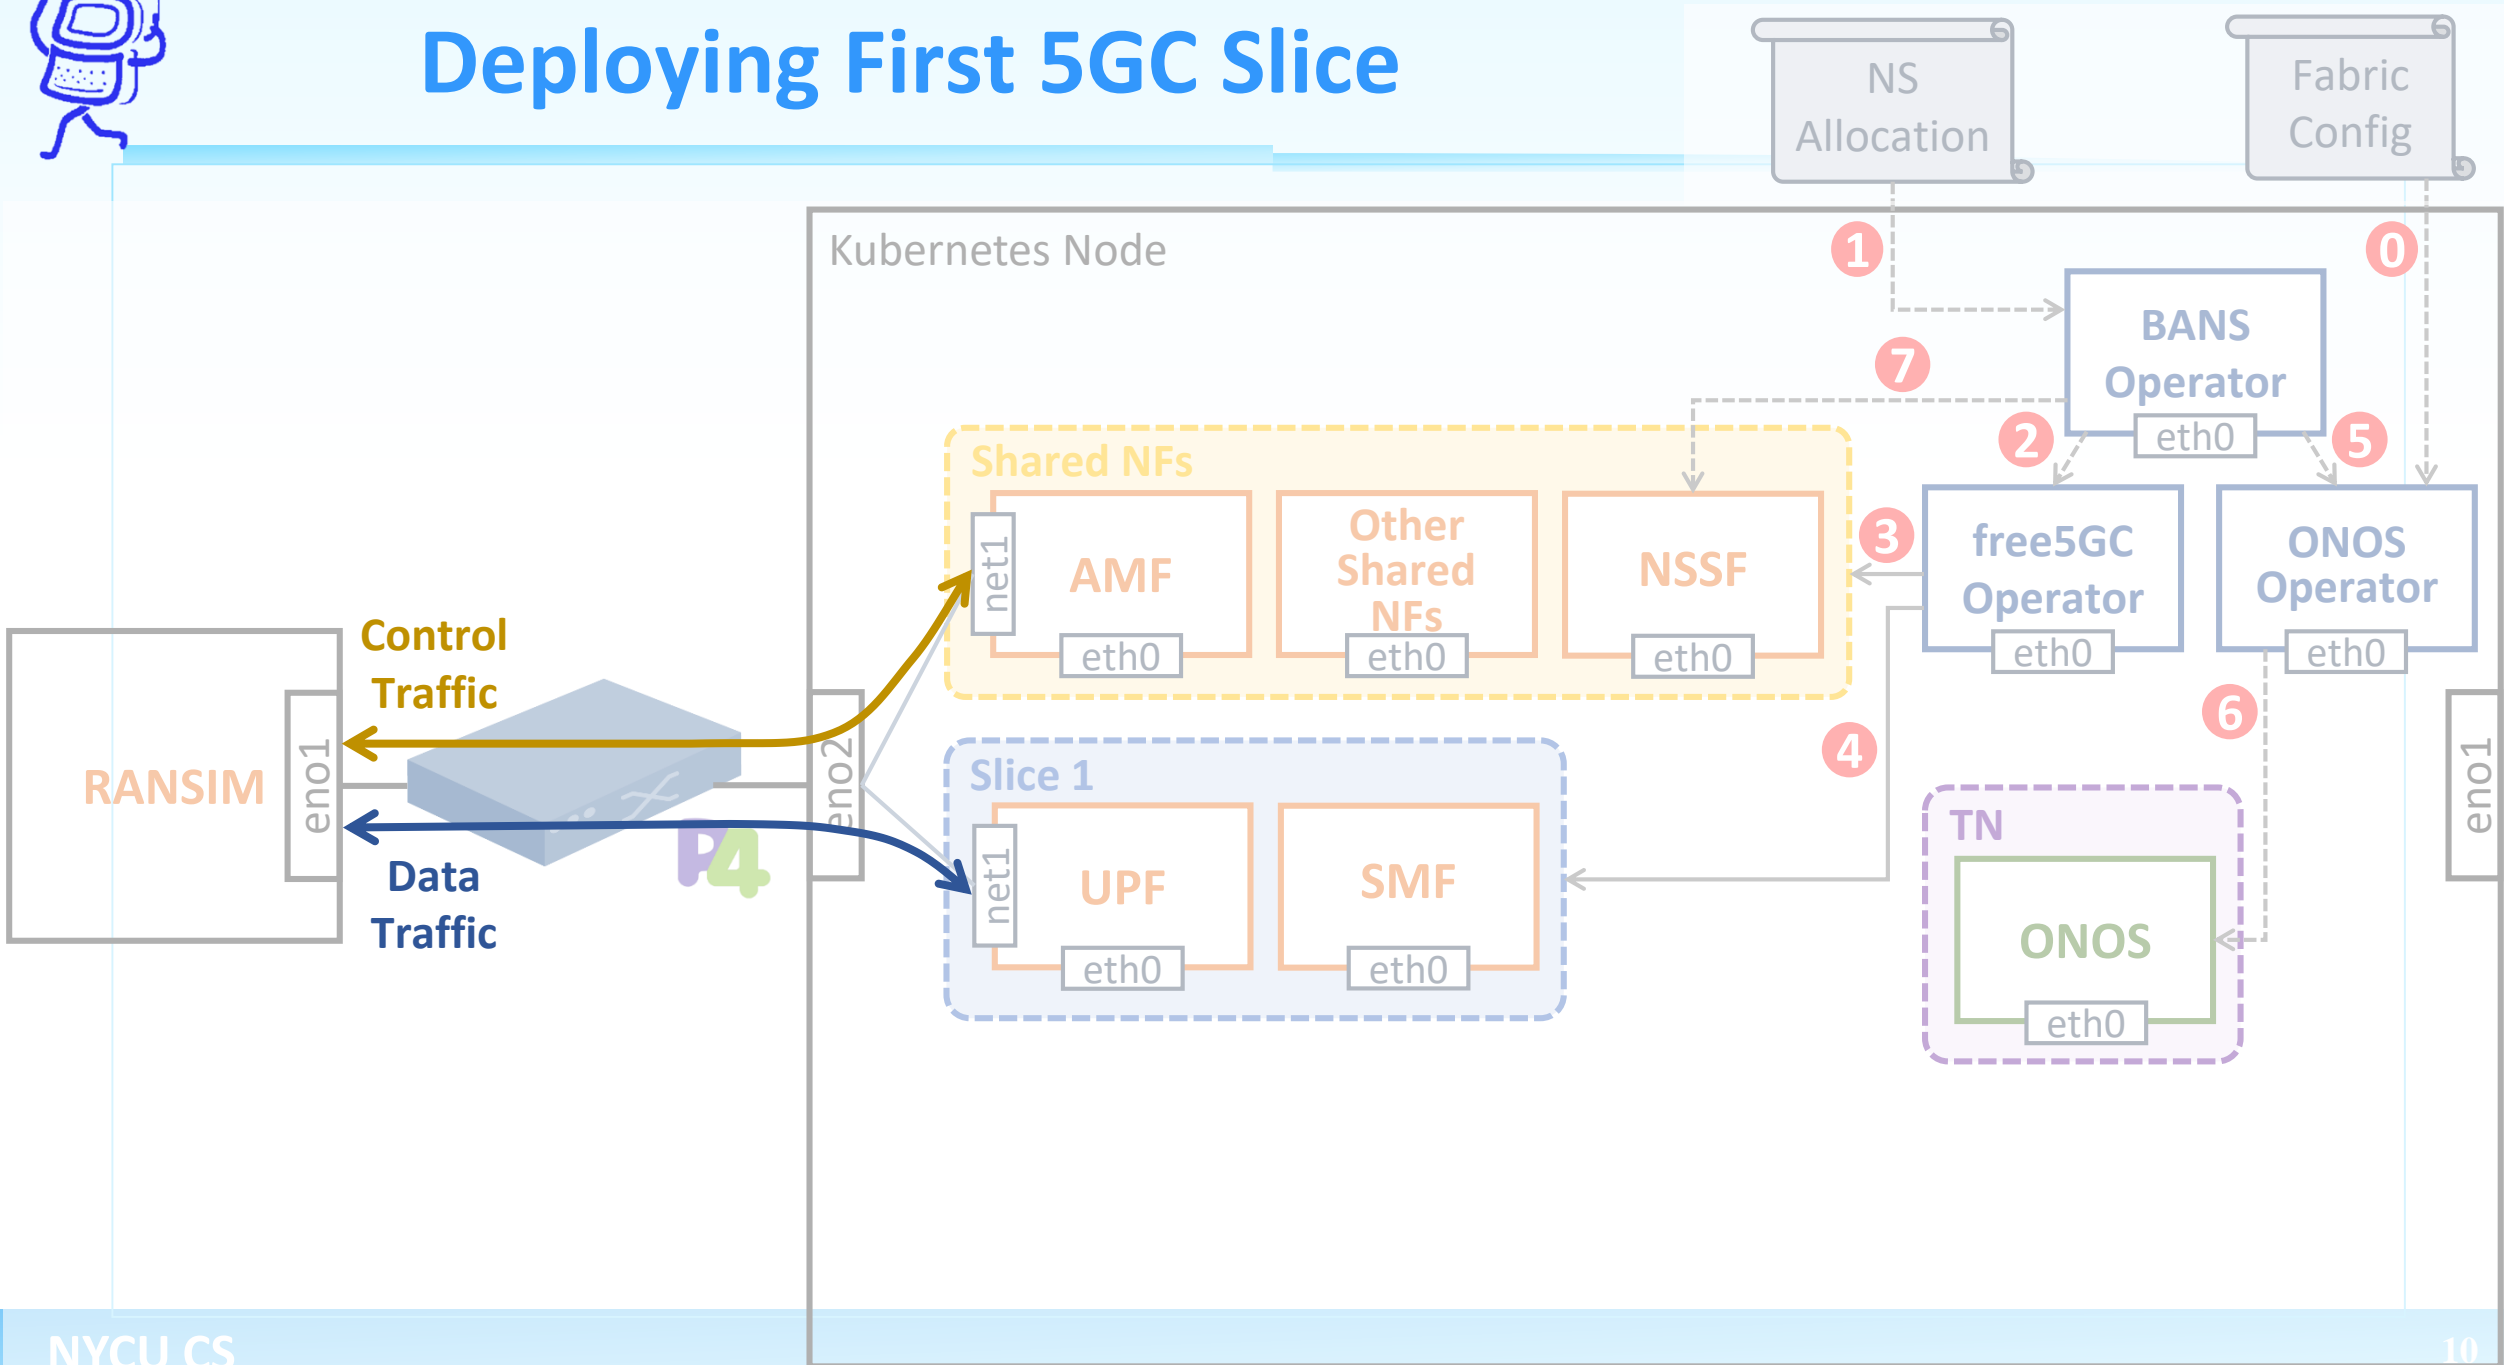

- P4 Fabric Switch
 - Place between RANSIM server and Kubernetes node of core NFs
 - Require fabric configuration on ONOS Bandwidth Operator
- Leverage SR-IOV on interfaces toward RANSIM for core NFs, e.g. AMF and UPF
 - Hardware acceleration

SR-IOV (Single-Root Input/Output Virtualization)

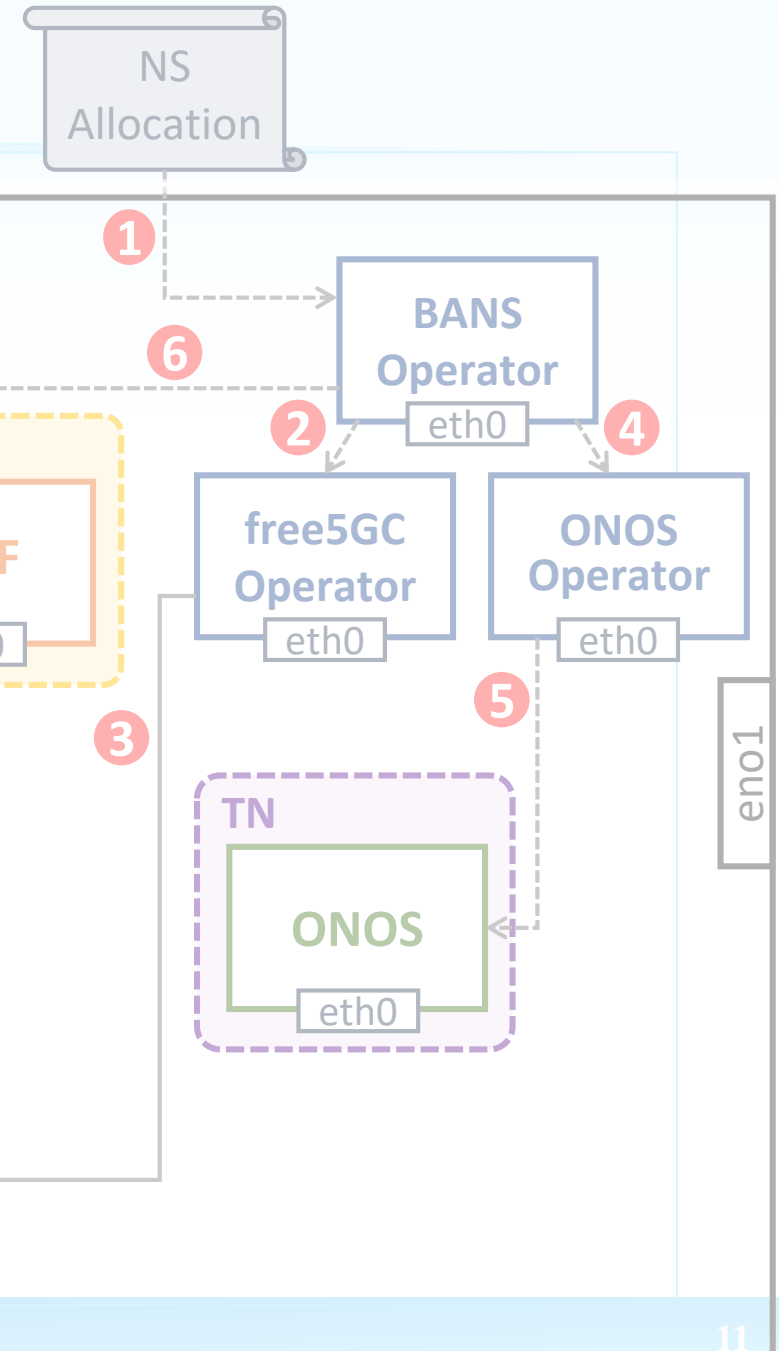

Deploying First 5GC Slice

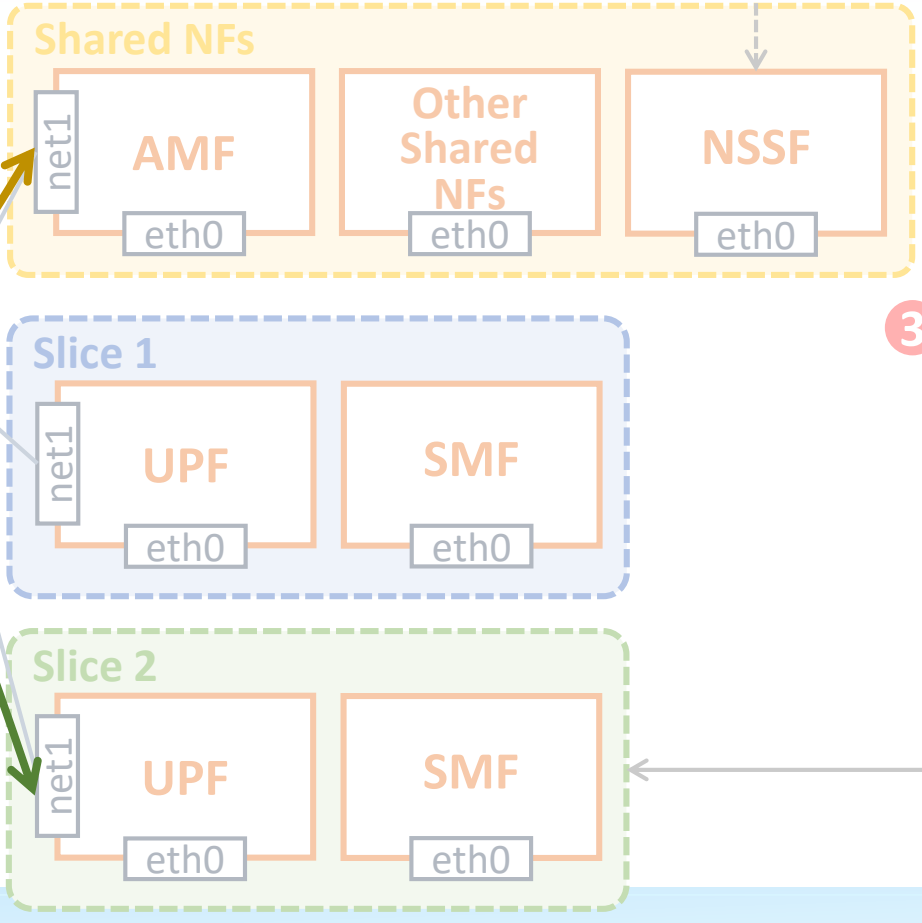

Deploying Subsequent 5GC Slice

Kubernetes Node

Control Traffic

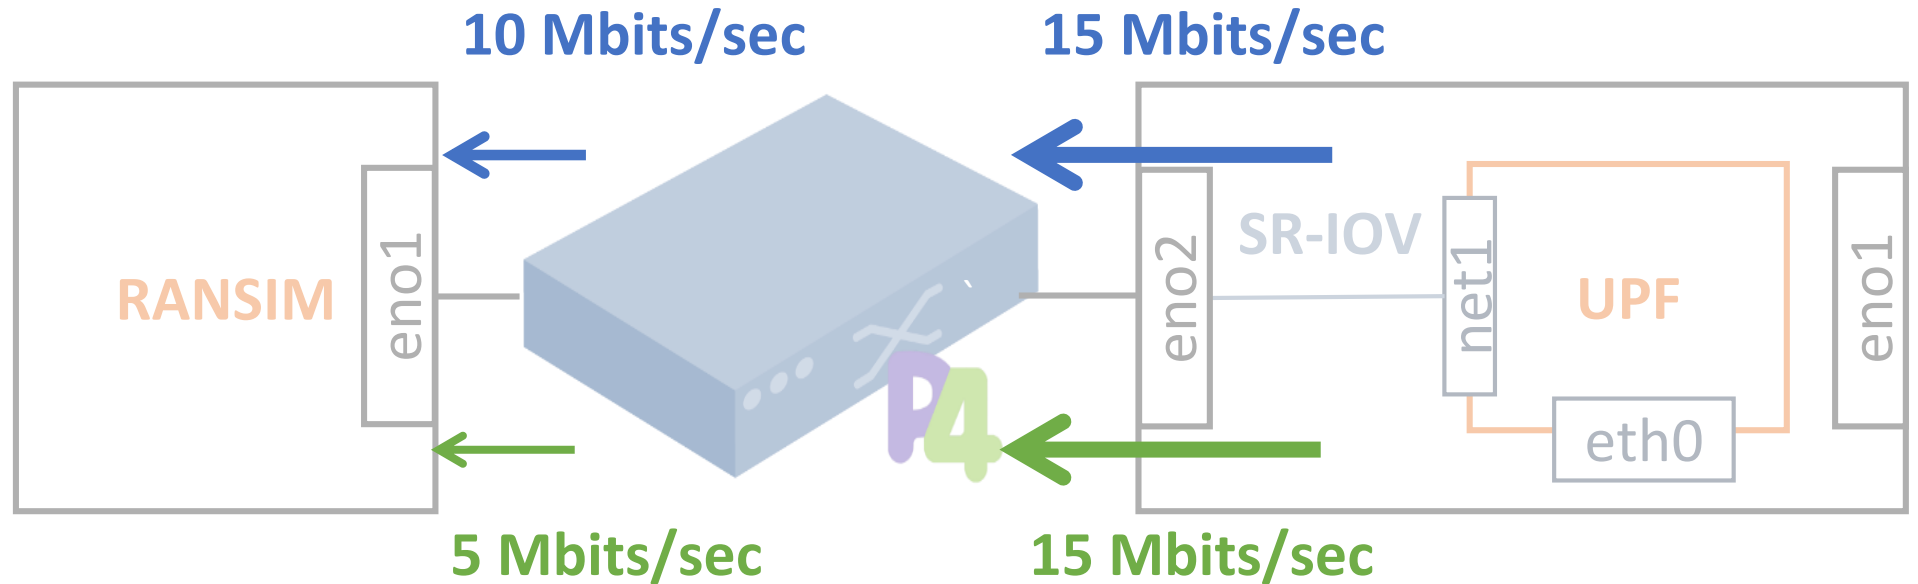

Data Traffic

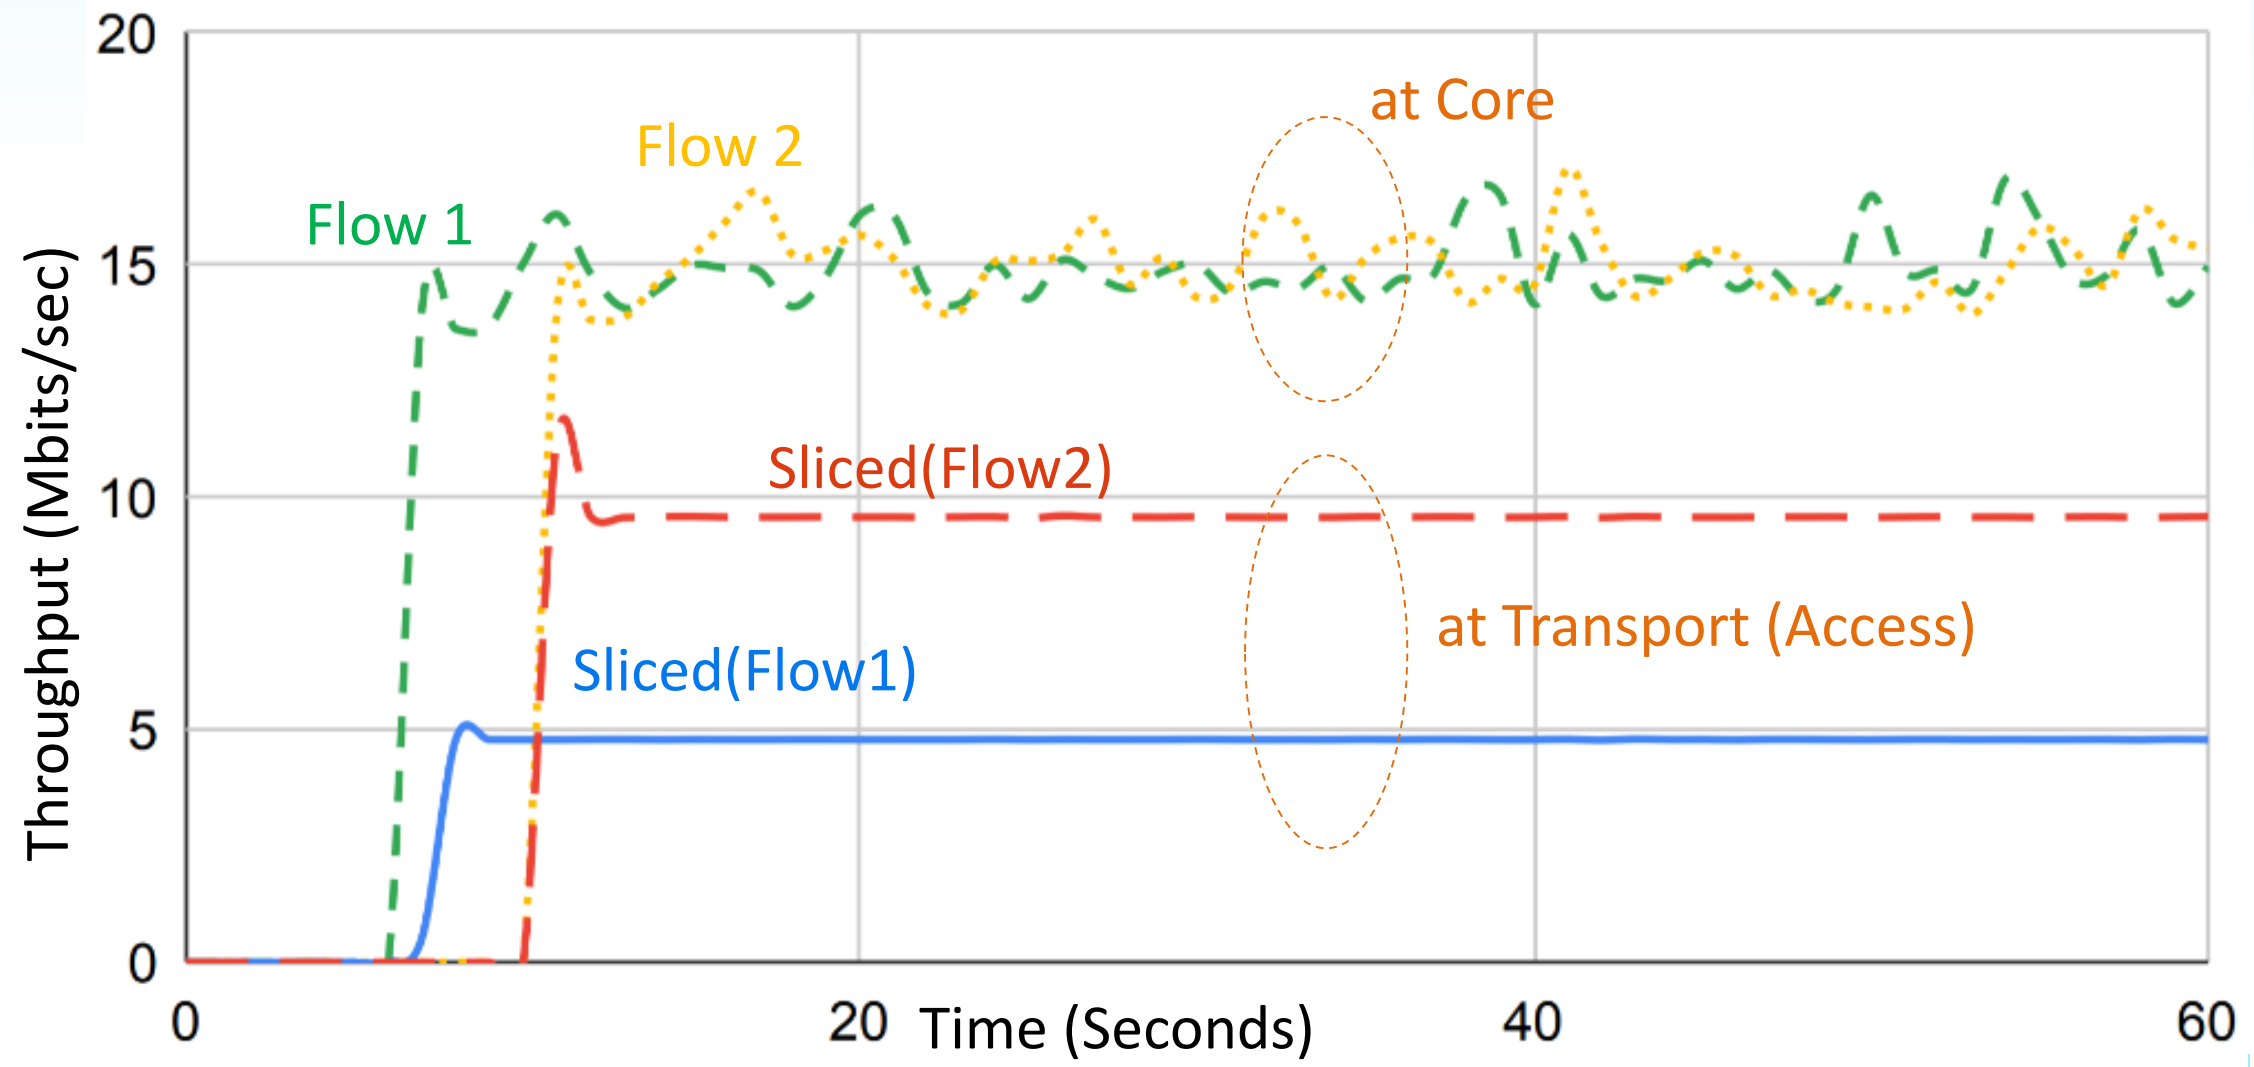

Transport Network Slicing on P4 Fabric

- Two flows (Flow1 and Flow2): send ICMP packets continuously
 - Transmission Rate: around 15 Mbits/sec
- Bandwidth Limitation on TN slices
 - Downlink bandwidth limiting,
 - Sliced(Flow1): 5 Mbits/sec
 - Sliced(Flow2): 10 Mbits/sec

Downlink Throughput of Two Slices

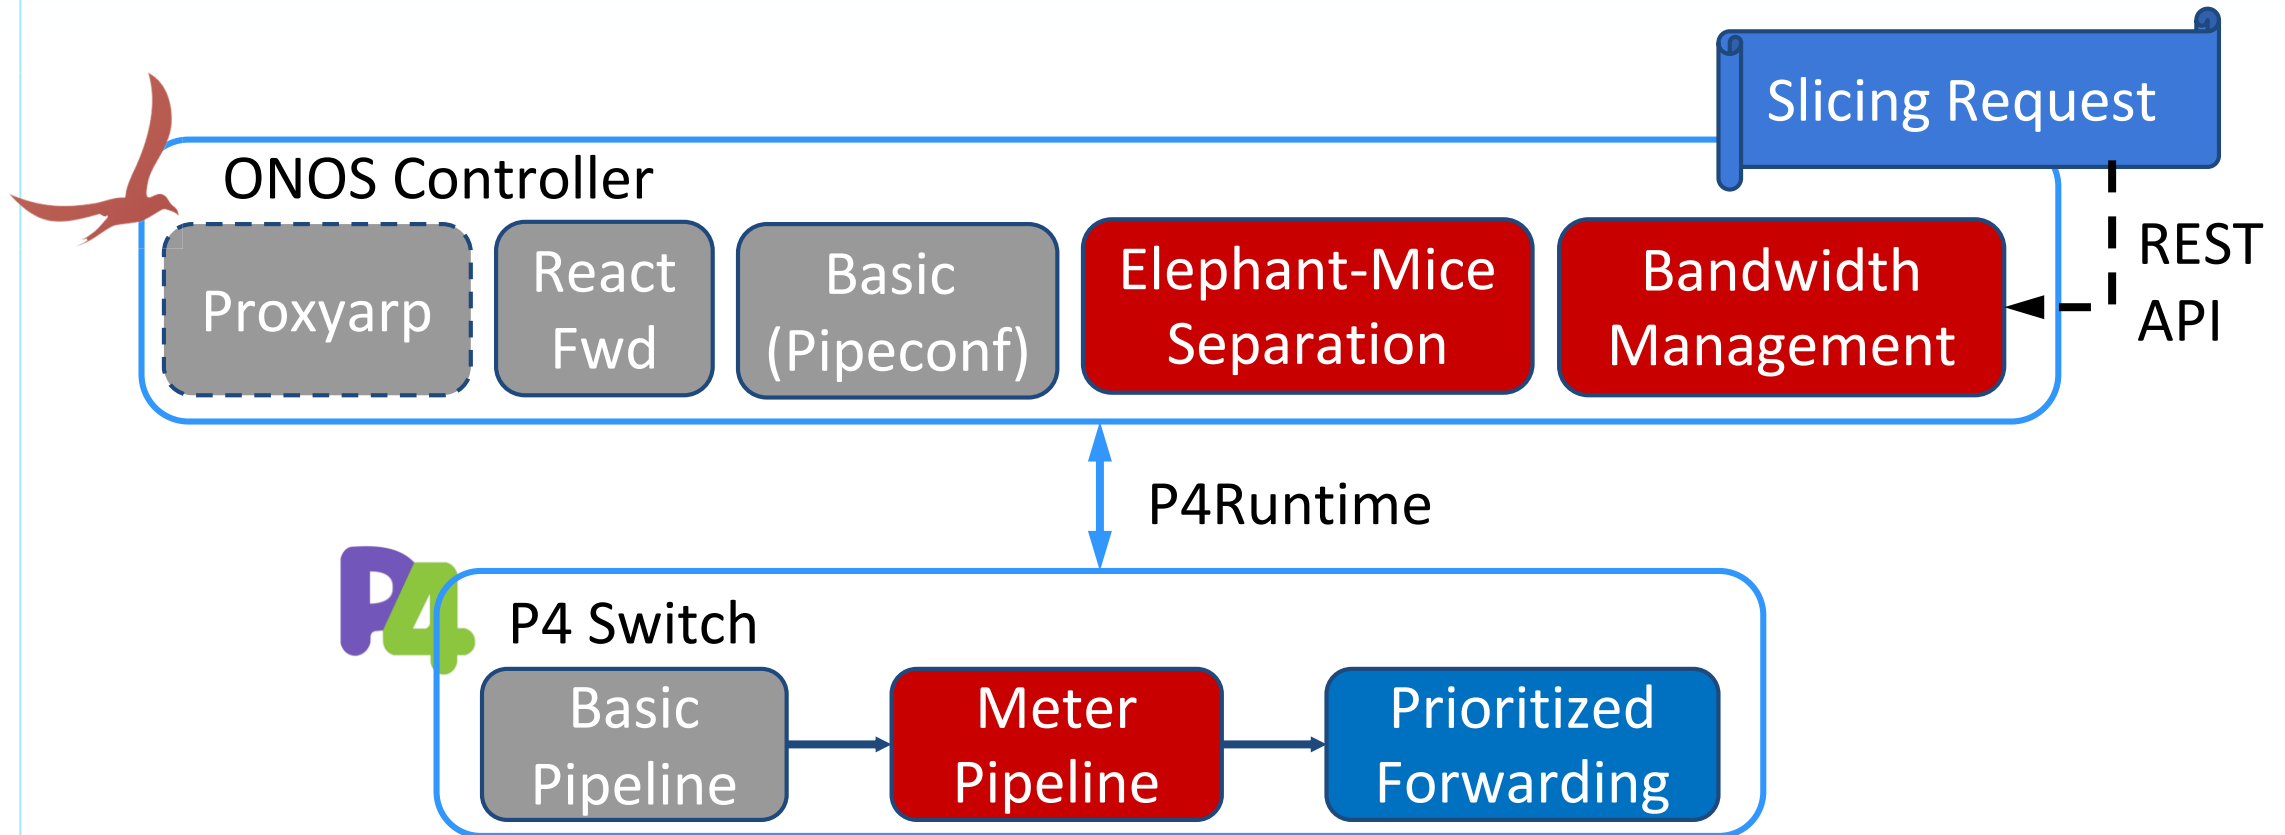

P4-TINS: P4-enabled Traffic Isolation for Network Slicing

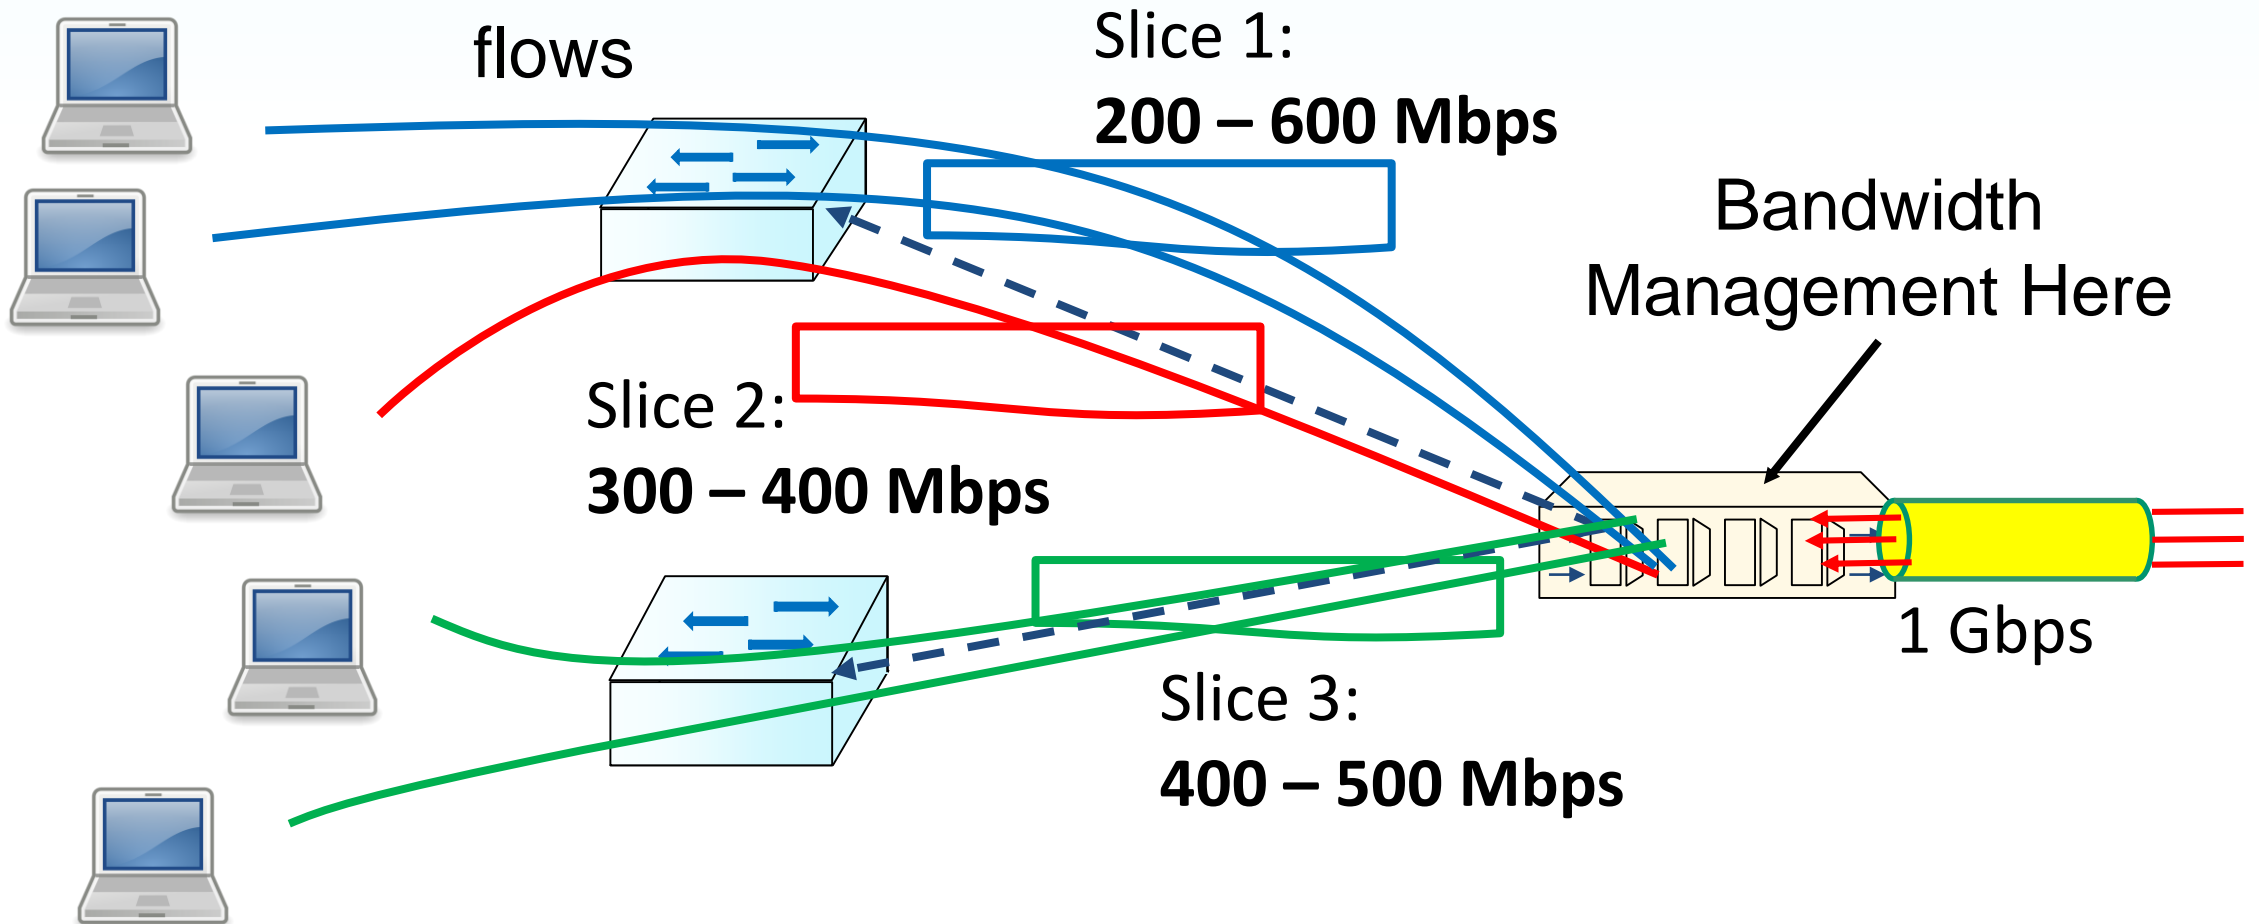

with Flow-based Bandwidth Guarantee and Management

- Control Plane: Two P4-TINS applications on ONOS
- Data Plane: P4 switch with Meter pipeline and Prioritized Forwarding
- Protocol: P4Runtime

- Slices with different bandwidth guarantees and limitings

P4 Meter

trTCM: Two Rate Three Color Marker

CIR: Committed Information Rate

PIR: Peak Information Rate

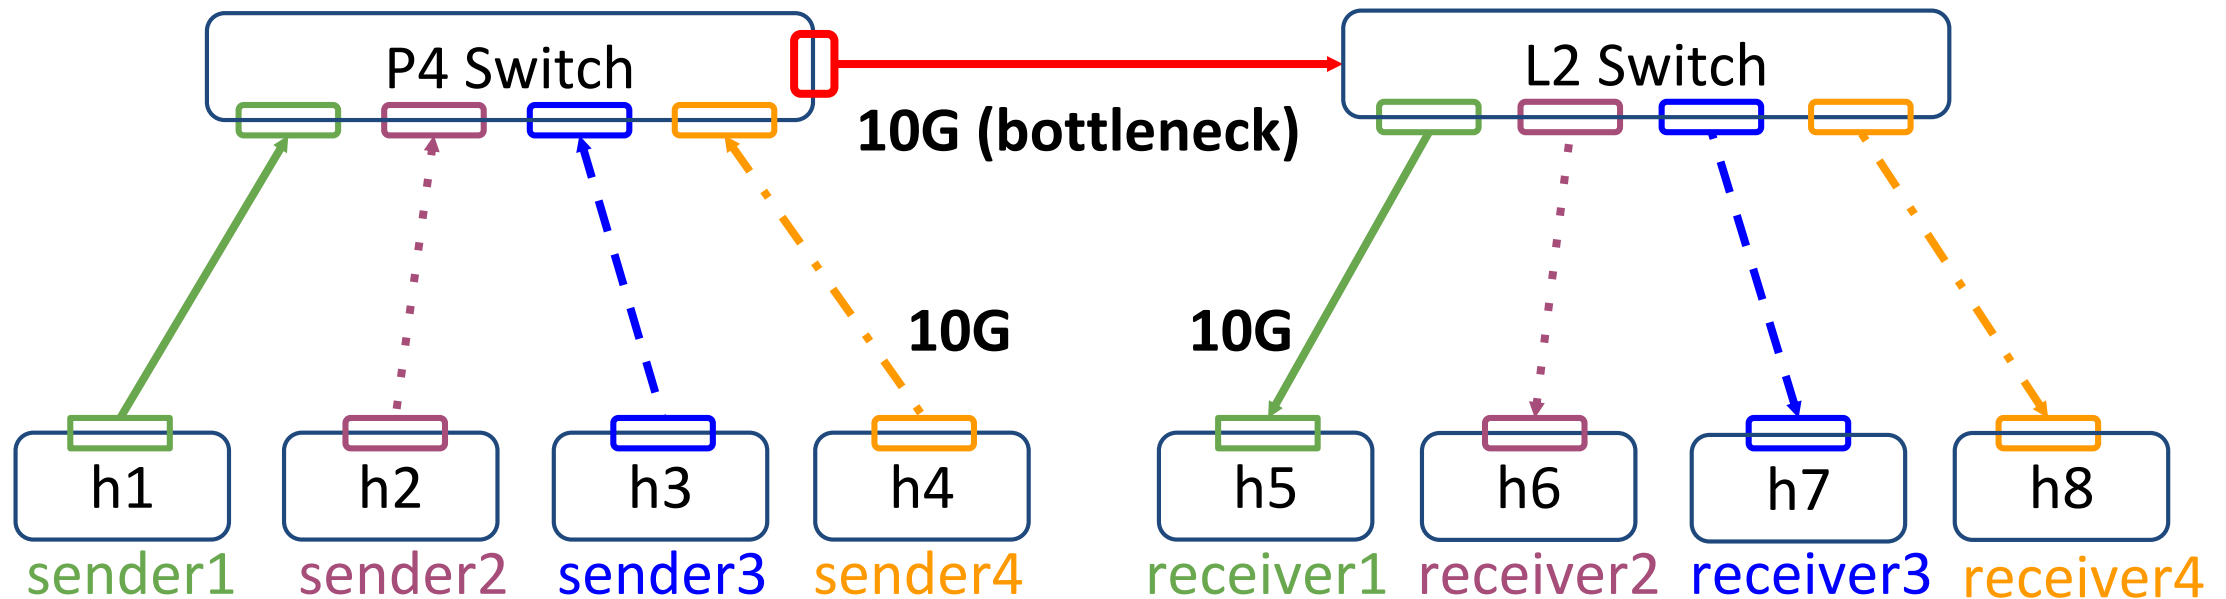

- Mechanism for measuring data rate
 - Line-rate QoS classifier
 - Managed through P4 Extern Library
- Using RFC 2698-trTCM to classify packets into three groups
 - Green
 - Yellow
 - Red

Experiment Environment and Scenario

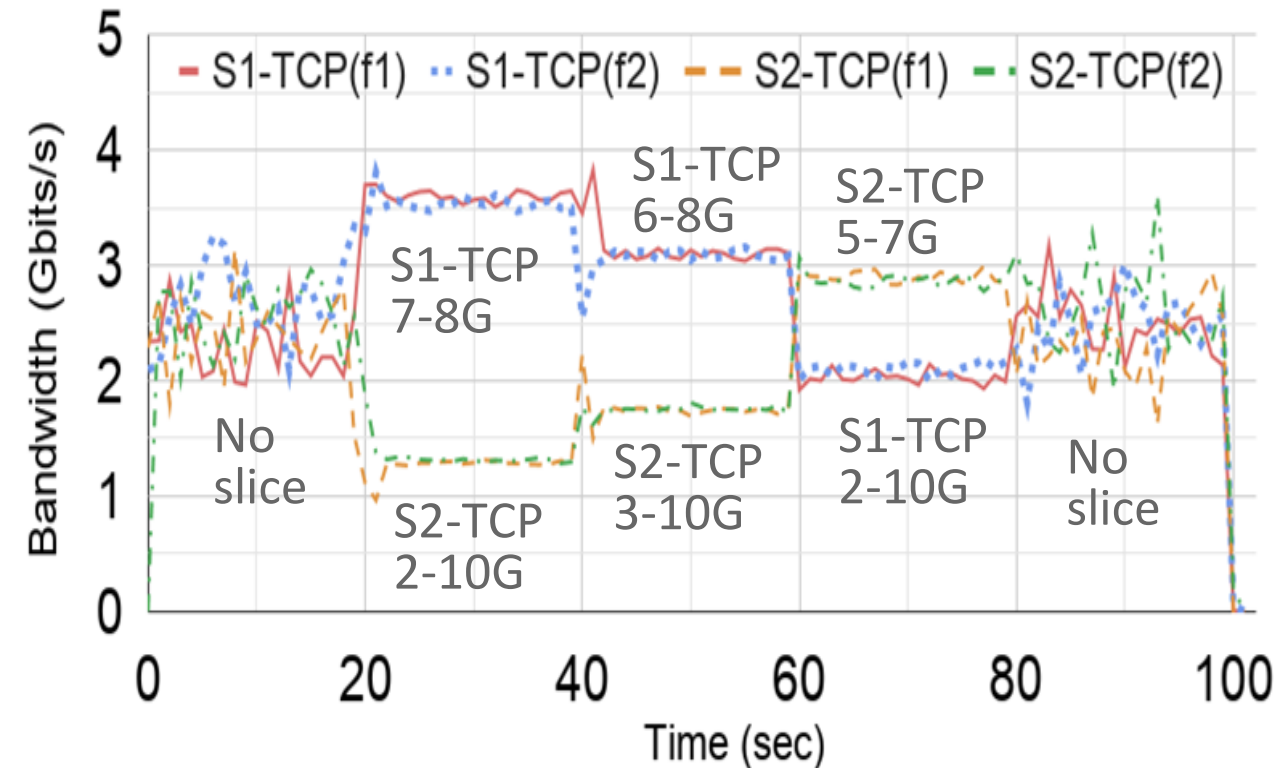

- Testbed
 - Inventec P4 switch (D10056 - Gulmohar2.0T/Intel D-1527/8G)
 - A L2 Switch for traffic measurement
 - Servers (Intel E5-2630/128G/Intel-X710 10GbE) for traffic generation
- Iperf for TCP/UDP flows,
- Http request for Mice TCP flows

Two Slices: Two TCPs in each Slice

- Slice 1: Two TCPs, S1-TCP(f1), S1-TCP(f2),
- Slice 2: Two TCPs, S2-TCP(f1), S2-TCP(f2)

- Flows in same slice fair share sliced bandwidth
- Slices share residual bandwidth proportionally

Two TCPs in One Slice and Two UDPs in the Other

- Slice 1: Two UDPs, S1-UDP(f1), S1-UDP(f2),
- Slice 2: Two TCPs, S2-TCP(f1), S2-TCP(f2)

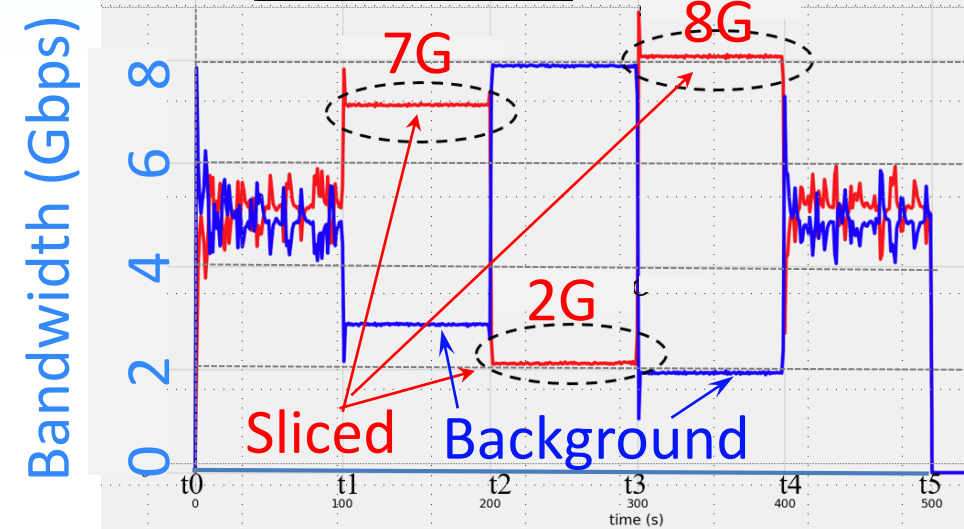

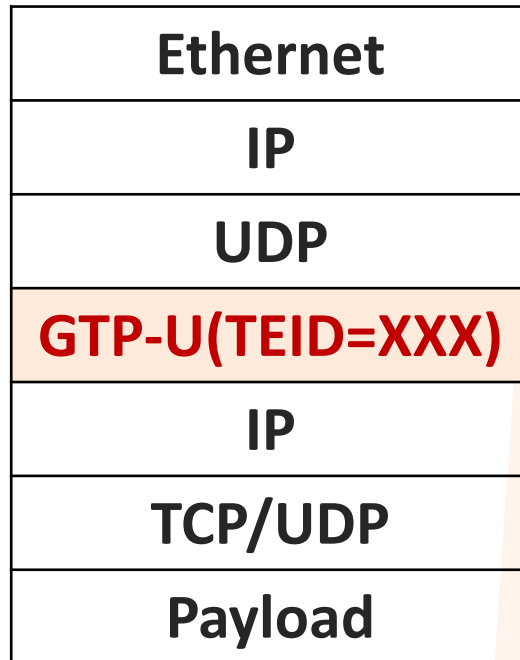

- Flows in same slice share sliced bandwidth fairly
- Slices share residual bandwidth proportionally

P4-enabled Network Slicing and MEC Services

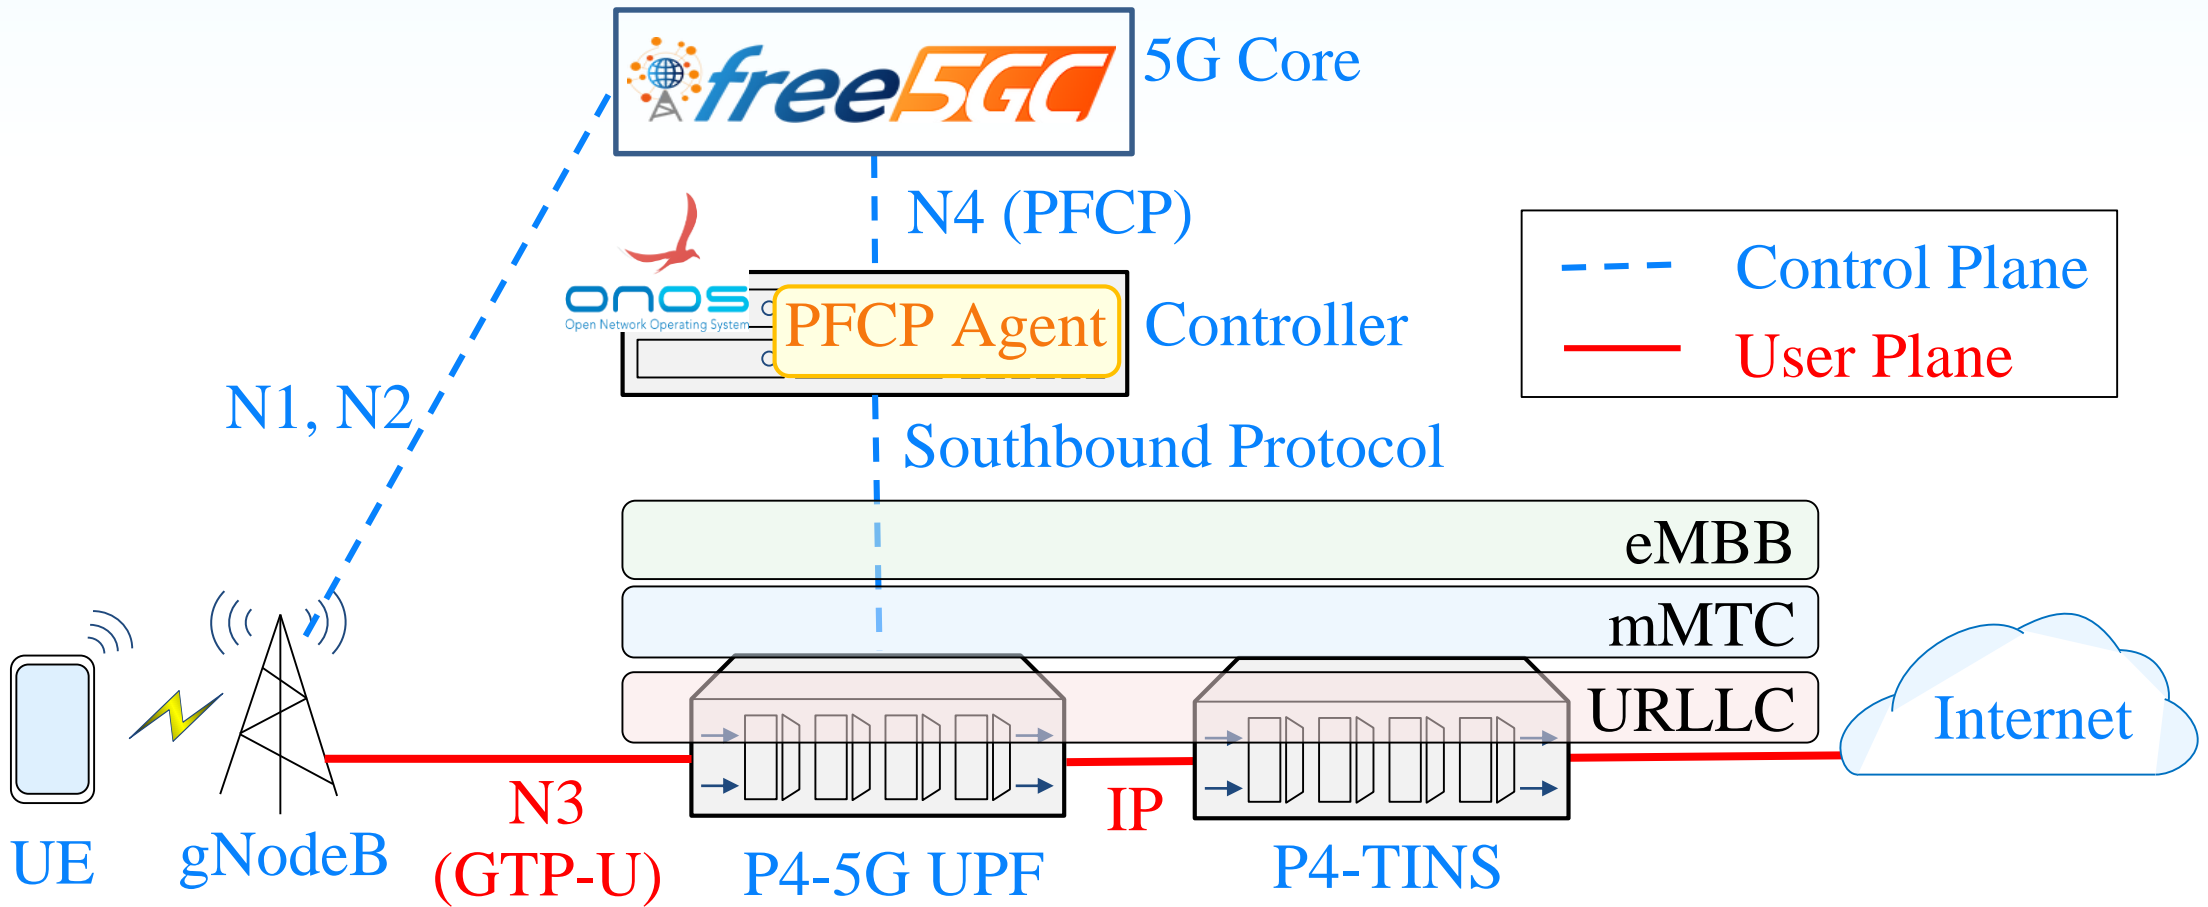

- Bandwidth Management for Transport Network Slices
- P4-enabled 4G User Plane for MEC
 - GTP-U De-cap/encap Hardware Offloading

■ Presented at ONF Connect 2019

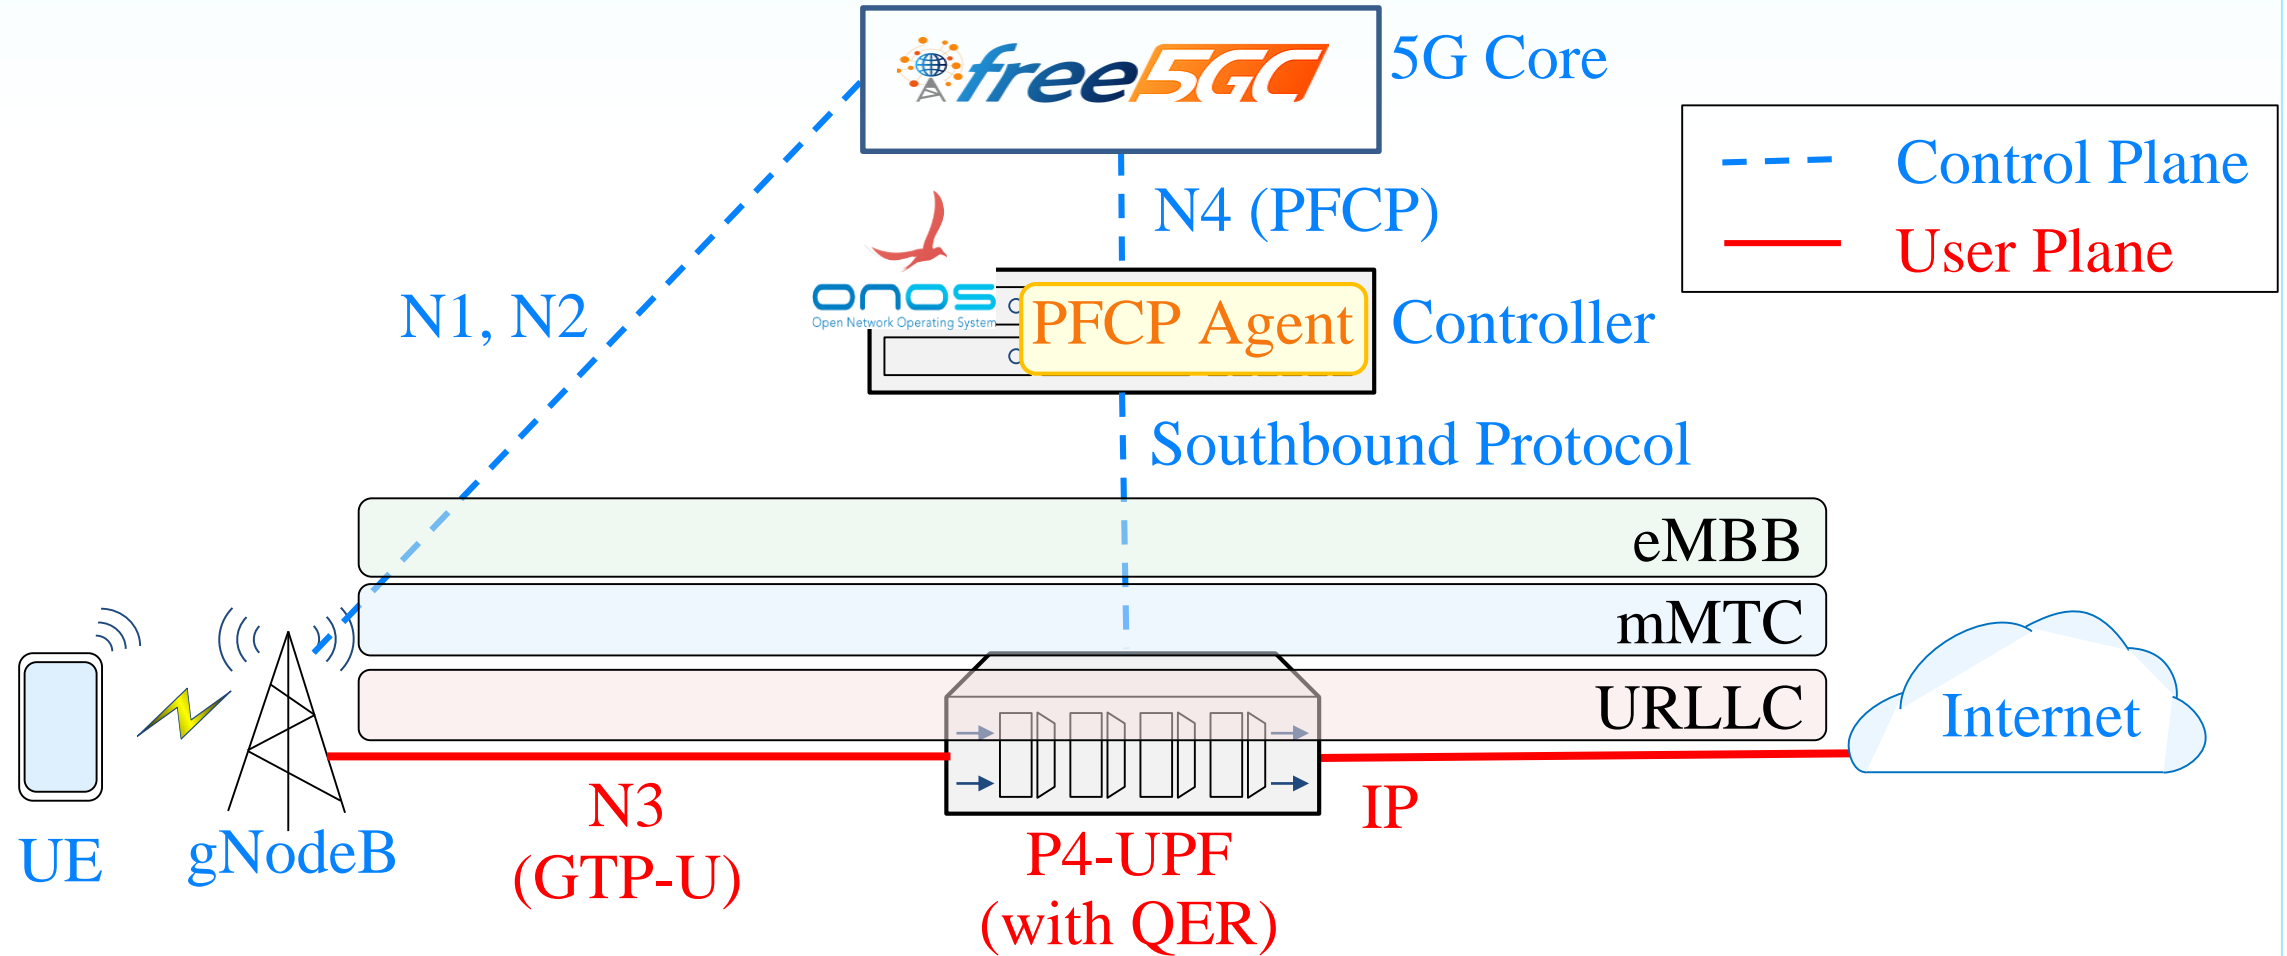

P4-enabled 5G UPF with Network Slicing

P4-enabled UPF with QoS Enforcement Rules

Q & A

Evaluation

Resource Usage and Bandwidth Policies on TN Slices

Environment Setup

- Software
 - Ubuntu 16.04
 - free5GC Stage 2 Release
- Hardware
 - Quanta D51B-1U server
 - CPU 40 cores
 - RAM 128 Gigabytes
 - Inventec D10056 P4 switch

Details of MANO Framework and BANSs

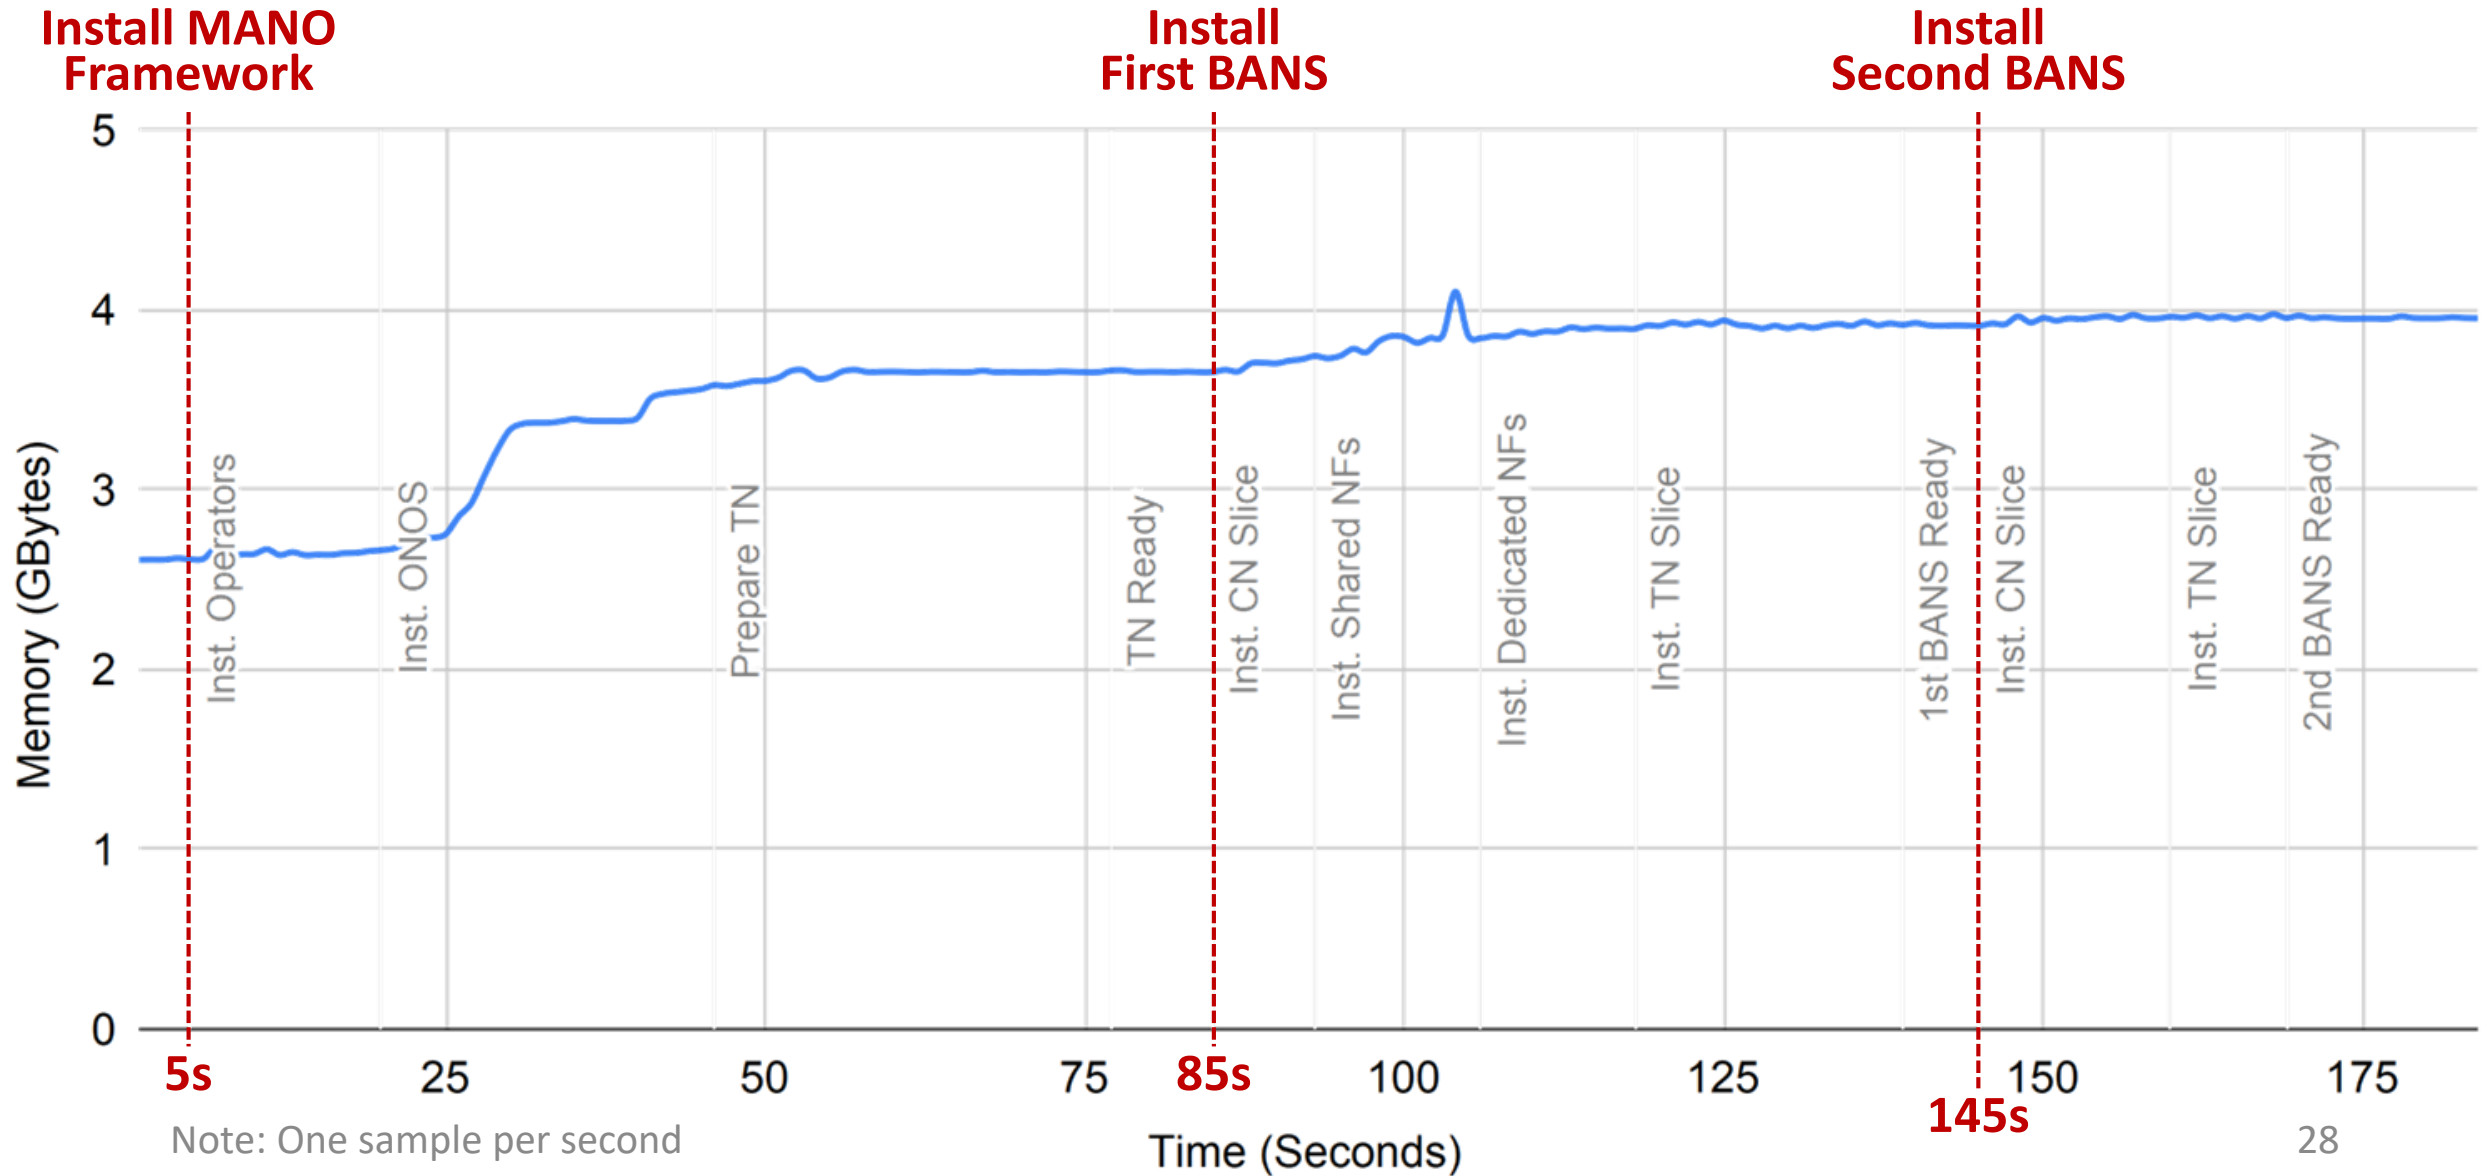

Deployment Object		BANS-5GC with P4 Fabric
MANO Framework		<ul style="list-style-type: none"> ● Creation of three Operators ● Preparation of TN environment
First BANS	5G CN Slice	<ul style="list-style-type: none"> ● Creation of shared slice ● Creation of dedicated slice
	TN Slice	<ul style="list-style-type: none"> ● Configuration of bandwidth slice
Subsequent BANS	5G CN Slice	<ul style="list-style-type: none"> ● Creation of dedicated slice
	TN Slice	<ul style="list-style-type: none"> ● Configuration of bandwidth slice

Deployment Time of MANO Framework and BANSs

Deployment Time (sec.)		BANS-5GC with P4 Fabric	
MANO Framework		71.02	
First BANS	5G CN Slice	52.15	32.7 (62.7%)
	TN Slice		18 (34.52%)
Subsequent BANS	5G CN Slice	33.21	13.2 (39.75%)
	TN Slice		18.9 (56.91%)

Note: Average of ten times of deployment

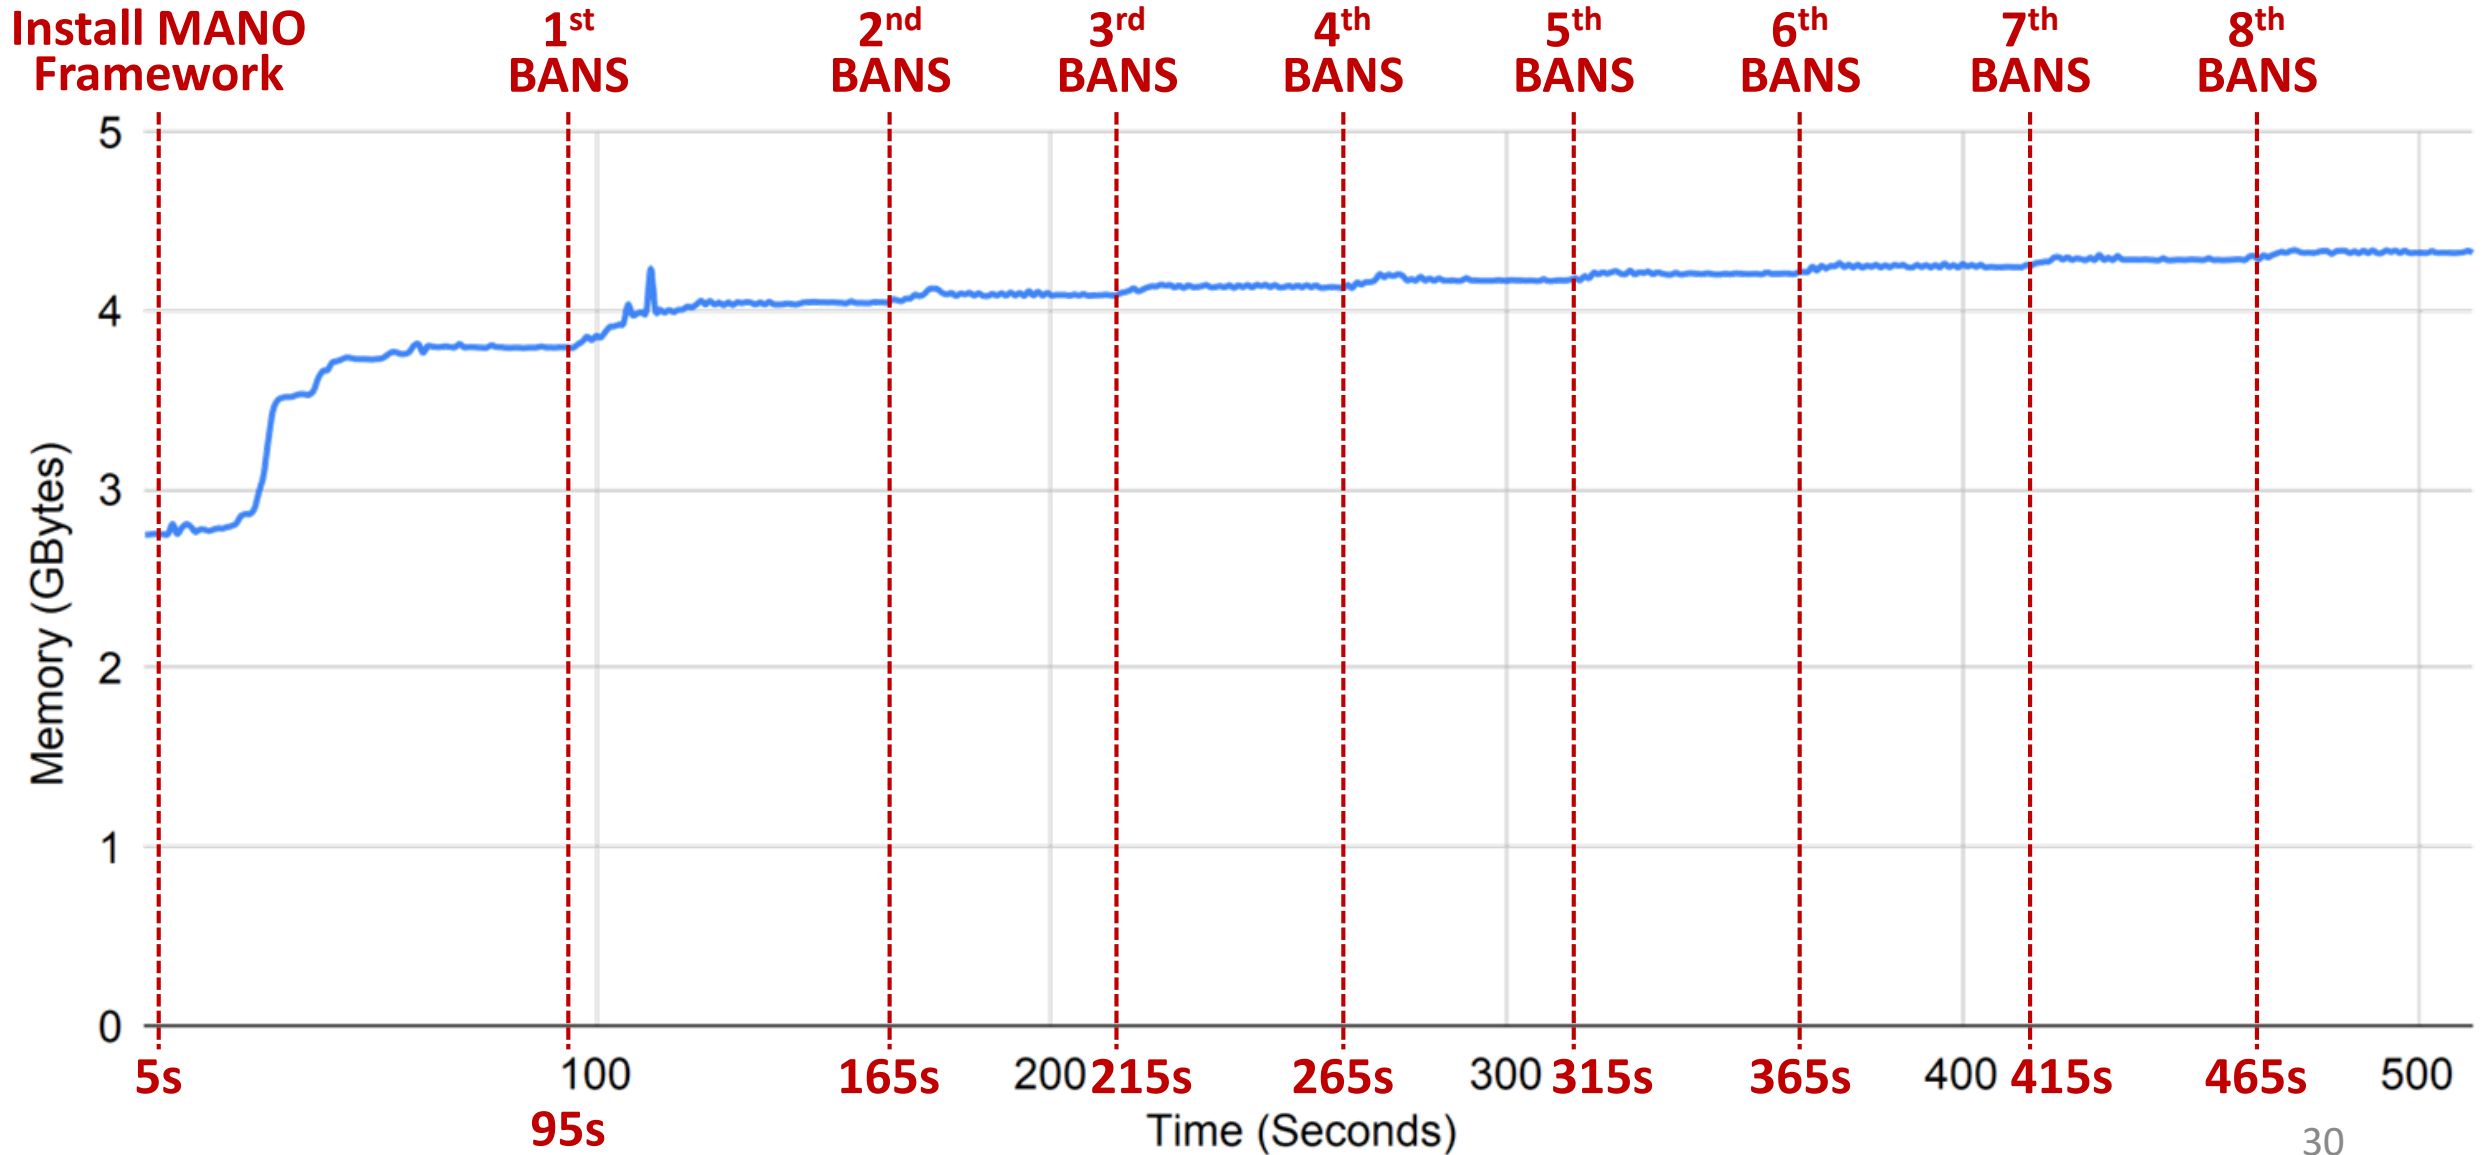

Memory Usage of MANO Framework and BANs

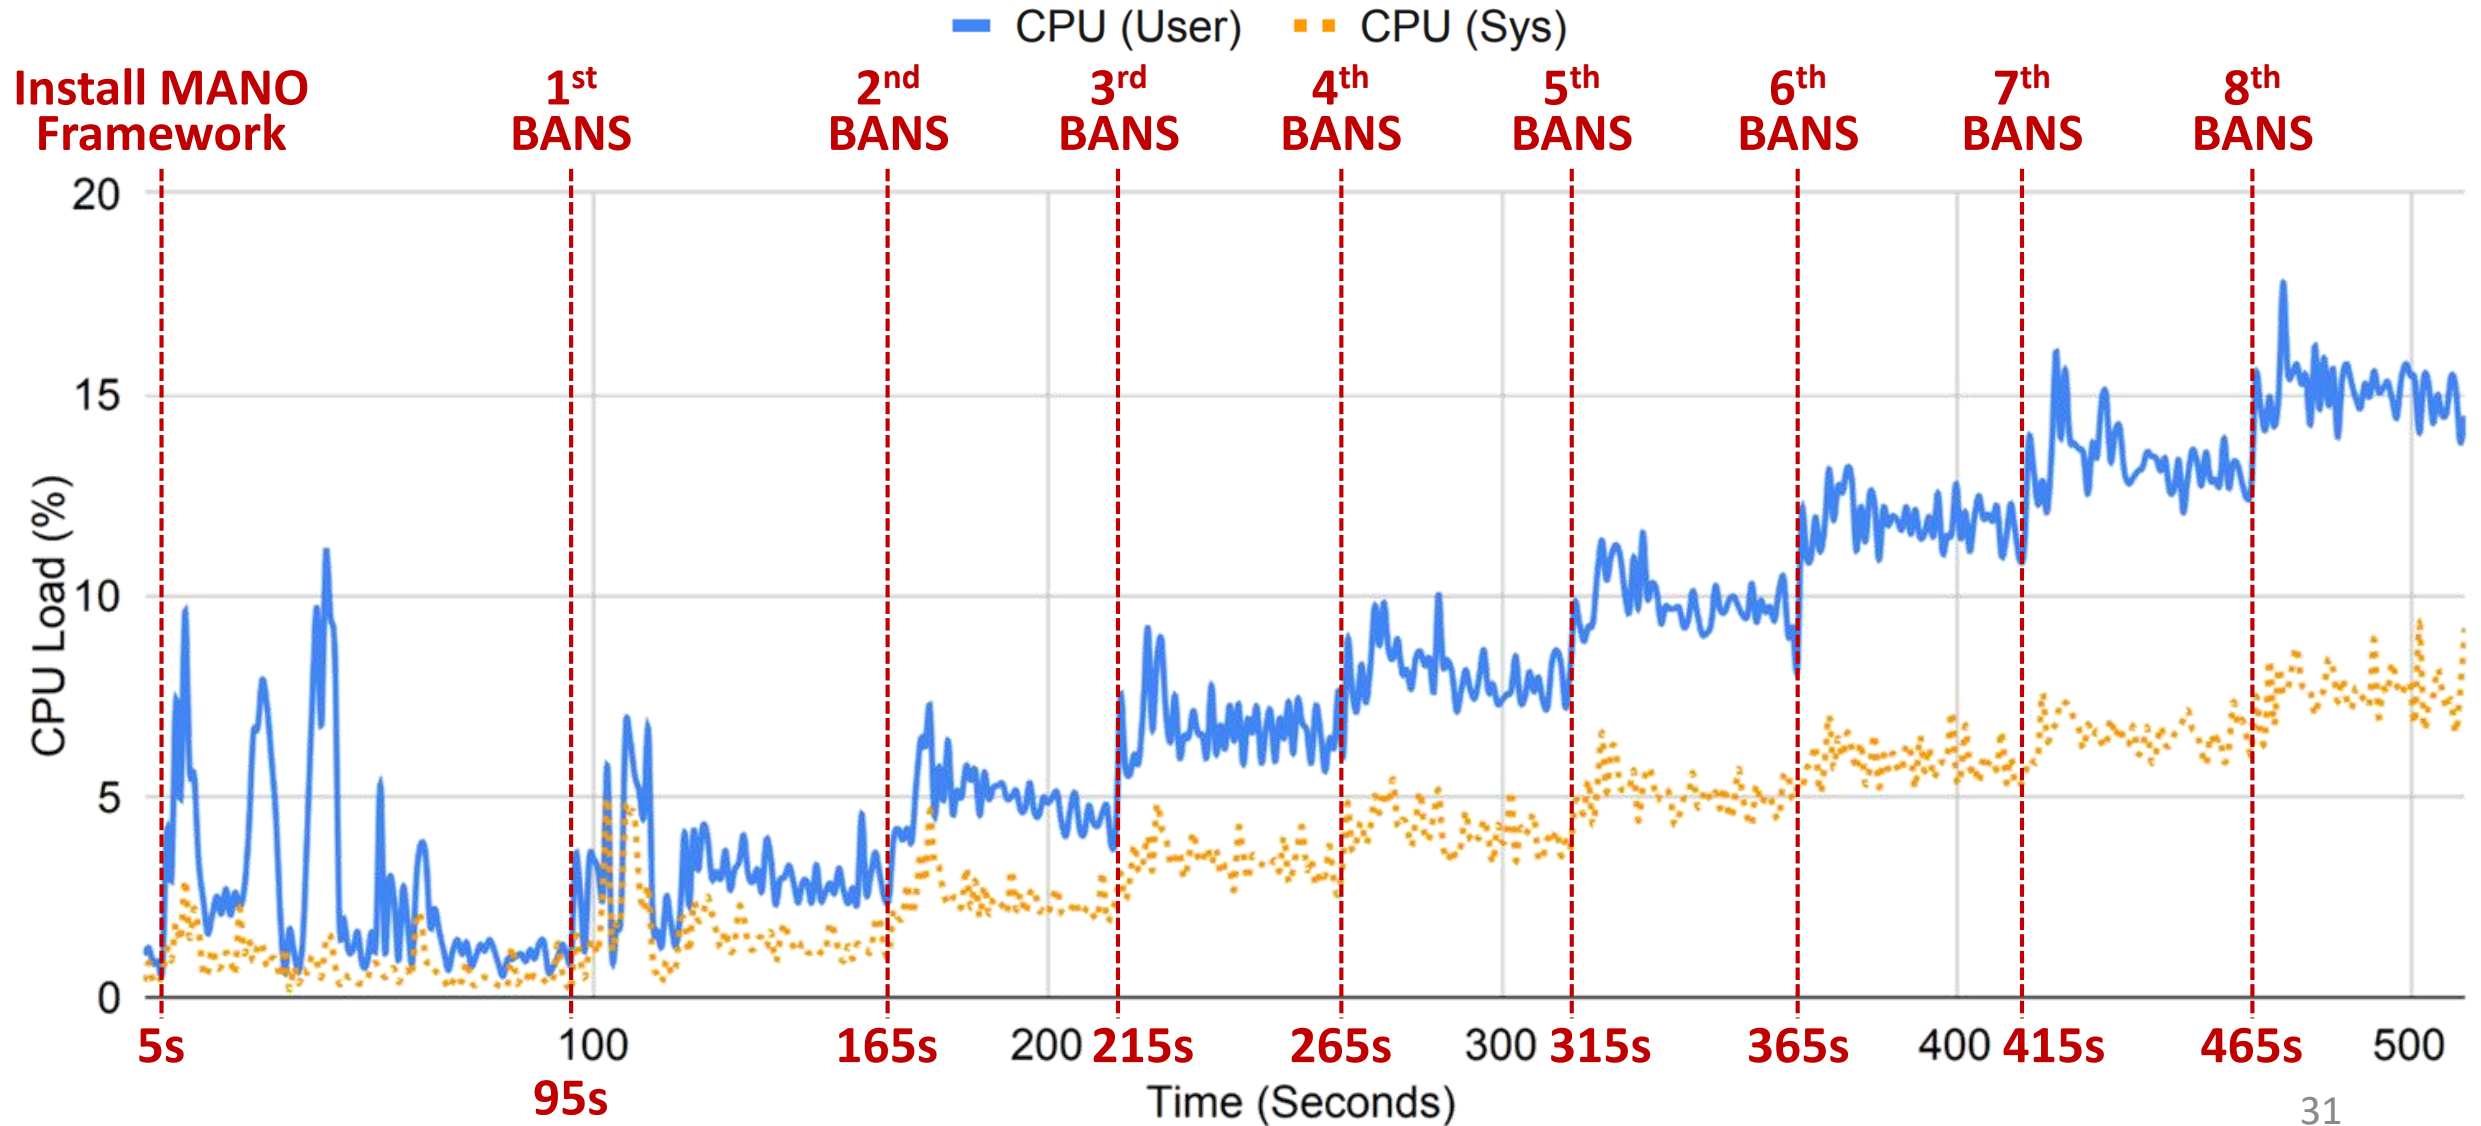

CPU Load of MANO Framework and BANSs

Memory Usage of Deploying Numerous Slices

CPU Load of Deploying Numerous Slices

Packet Classification of trTCM

- Two Rate Three Color Marker (trTCM):

- Committed Information Rate (CIR)
- Committed Burst Size (CBS):
- Peak Information Rate (PIR):
- Peak Burst Size (PBS):
